MAINTENANCE MANUAL Part1
1st Edition (Revised 9)

警告

このマニュアルは、サービス専用です。

お客様が、このマニュアルに記載された設置や保守、点検、修理などを行うと感電や火災、人身事故につながる可能性があります。

危険をさけるため、サービストレーニングを受けた技術者のみご使用ください。

WARNING

This manual is intended for qualified service personnel only.

To reduce the risk of electric shock, fire or injury, do not perform any servicing other than that contained in the operating instructions unless you are qualified to do so. Refer all servicing to qualified service personnel.

WARNUNG

Die Anleitung ist nur für qualifiziertes Fachpersonal bestimmt.

Alle Wartungsarbeiten dürfen nur von qualifiziertem Fachpersonal ausgeführt werden. Um die Gefahr eines elektrischen Schlages, Feuergefahr und Verletzungen zu vermeiden, sind bei Wartungsarbeiten strikt die Angaben in der Anleitung zu befolgen. Andere als die angegebenen Wartungsarbeiten dürfen nur von Personen ausgeführt werden, die eine spezielle Befähigung dazu besitzen.

AVERTISSEMENT

Ce manuel est destiné uniquement aux personnes compétentes en charge de l'entretien. Afin de réduire les risques de décharge électrique, d'incendie ou de blessure n'effectuer que les réparations indiquées dans le mode d'emploi à moins d'être qualifié pour en effectuer d'autres. Pour toute réparation faire appel à une personne compétente uniquement.

Manual Structure

Purpose of this manual

This manual is the maintenance manual of digital videocassette recorder DVW-A500P, 500P, A500P/1 and 500P/1.

This manual describes the maintenance information of this unit, and the information on primary services such as the replacement of main blocks and circuit boards.

Contents

The following is a summary of all the sections for understanding the contents of this manual.

Refer to the Installation and Maintenance Manual for information exclusive to the DVW-A500P/1 and 500P/1.

Section 1 SERVICE OVERVIEW

Explains the locations of main part, the functions of printed circuit board, the removal and installation of cabinet, and the measures against trouble.

Section 2 RECORDING FORMAT, HEAD CONFIGURATION, AND SIGNAL PROCESSING

Explains the recording format, head configuration, and signal processing.

Section 3 BLOCK DIAGRAMS AND CIRCUIT DESCRIPTIONS

Describes the overall block diagrams, the block diagrams for every circuit block, the frame wiring, and the circuit descriptions.

Section 4 ERROR MESSAGES AND TROUBLESHOOTING

Explains the error messages.

Section 5 MAINTENANCE MODE

Explains the maintenance mode of this unit.

Section 6 REPLACEMENT OF POWER BLOCK AND CIRCUIT BOARDS

Explains how to replace the power block and circuit boards, and how to adjust them after replacement.

Section 7 PERIODIC MAINTENANCE AND INSPECTION

Explains the cleaning procedure and periodic check.

Section 8 REPLACEMENT OF PERIODIC MAINTENANCE PARTS

Explains how to replace the parts that should be replaced periodically and how to adjust them after replacement.

Section 9 SPARE PARTS

Describes the exploded views for the main unit and optional accessories, mounted circuit boards list, packing materials list, and standard accessories list.

Relative manual

Besides this “Maintenance Manual Part 1”, the following manuals are available for the DVW-A500P, 500P, A500P/1 and 500P/1.

- **Operation Manual (Supplied with the VTR.)**

This manual is necessary for application and operation of the VTR.

- **Installation Manual (Supplied with the VTR.)**

This manual describes the items that are required to install the VTR.

- **Installation and Maintenance Manual
(Supplied with the DVW-A500P/1, 500P/1 or the BKDW-515)**

This manual is necessary for installation or maintenance of the control panel BKDW-515.

- **Maintenance Manual Part 2 (available on request)**

This manual describes the information items (adjustments, board layouts, schematic diagrams, detailed parts list, etc.) that premise the service based on parts. If this manual is required, please contact to Sony’s service organization.

- **Protocol Manual (available on request)**

- **PROTOCOL OF REMOTE-1 (9-Pin) CONNECTOR**

This manual explains the protocol for controlling the VTR via the RS-422A (9-pin serial remote).

If this manual is required, please contact to Sony’s service organization.

SECTION 1 SERVICE OVERVIEW

1-1. NOTES ON POWER SUPPLY BLOCK

1-1-1. Warning on Primary Circuit and Electric Shock

The power supply block consists of the AC-139 board and primary peripheral components. The whole AC-139 board is on the primary side circuit, so pay careful attention to the electric shock. Since the inside of a switching regulator is also on the primary side circuit, treat it with care.

1-1-2. Notes on Resetting the Circuit Breaker

When the breaker on the power supply panel is activated and the button is ejected, remove the cause of the trouble, then push the button.

1-2. REMOVAL/INSTALLATION OF CABINET

1-2-1. Cabinet Removal/Installation

Always switch off the POWER before removing and installing cabinet.

- Upper Control Panel**
1. Remove the upper lid.
 2. Remove the eleven control knobs on an upper control panel.
 3. Remove the each one screw on the left and right side.
 4. Fingers should be inserted in the space between the upper control panel and chassis, and remove the upper control panel as shown in the figure A.

5. When installing, insert the projections of the upper control panel into the holes of the chassis, then fix the panel with the screws as shown in the figure B.

1-2-2. Cassette Compartment Removal/Installation

Removal

1. Press the EJECT button with the power on.
2. Turn off the POWER.
3. Remove the upper lid.
(Refer to section 1-2-1. Cabinet Removal/Installation)
4. Remove the plate MD assembly. (Refer to Section 1-3. Removal/Installation of Plate MD)
5. Loosen two screws, and remove the cassette compartment bracket assembly.
6. Disconnect the connector (CN930) on the CL-29 board.

Removal of the Bracket Assembly

7. Remove the four legs of the Cassette Compartment for fixing the Position by lifting the Cassete Compartment slightly and straight with ㊦ portions (two portions) held.
8. Remove the Cassette Compartment by sliding up it raising up the rear part with the ㊧ portion held as shown in the figure.

NOTE

In this time, do not move the Cassette Compartment to right and left and do not widen the right and left side panels. If the right and left side panels are widened, a gear position might be changed or some parts might be removed.

Removal of the Cassette Compartment

9. When the Cassette Compartment is put away from the unit after removing, put it in the direction as shown in the figure (If it is put with the cassette lid at the bottom, the flexible card wire might be damaged).

Installation

10. Set the harness of the connector (CN930) disconnected in step 5 so it is not put between chassis.
11. Install the cassette compartment inserting slantingly in the direction as shown in the figure.
12. Insert the four legs of the Cassette Compartment for fixing the position into the four holes of the mechanical chassis for fixing the position by pressing the ㊦ portions (two portions) as shown in the figure.
13. After confirming that the cassette compartment is fixed to the chassis, install the cassette compartment bracket assembly.
14. Connect the connector (CN930) on the CL-29 board.

Installation of the Cassette Compartment

1-2-3. Connector Panel Removal/Installation

1. Turn off the POWER.
2. Remove six screws indicated → at the top and bottom on the connector panel.

Removal of Screws

3. Remove the connector panel so as not to stretch the harness as shown in the figure.
4. Install the connector panel in the reverse order of steps 1 through 3.

Removal of the Connector Panel

1-2-4. Power Supply Panel Removal/Installation

1. Turn off the POWER.
2. Remove two screws, and open the power supply panel.

Removal of the Power Supply Panel

3. Remove a screw and a spring washer which secure the ground terminal, then disconnect connector (CN002) on the AC-139 board, then remove the power supply panel.
4. Install the power supply panel in the reverse order of steps 1 through 3.

Disconnecting the Connector

1-3. REMOVAL/INSTALLATION OF PLATE MD

Removal

1. Remove the upper lid. (Refer to 1-2. Removal/Installation of Cabinet.)
2. Slide the knobs of the plate MD each in the direction indicated by the arrows (inside).

Sliding of the Knob Positions

3. Remove the plate MD.

Installation

4. Insert the plate MD into the clearance shown in the figure.

NOTE

Be careful not to put the harness under the plate MD in this case.

Removal/Installation of Plate MD

5. Slide the knobs of the plate MD each in the direction indicated by the arrows (outside), then fix.
6. Install the upper lid.

Fixing of the Plate MD

1-4. FUNCTIONS OF PRINTED CIRCUIT BOARD

The numbers in left columns of the board name are in common with the numbers of Section 1-5-1. Printed Circuit Board Locations.

No.	Board Name	Circuit Function	System Configuration
1	DIF-16	4:2:2 Component Serial Digital Interface with Embedded Audio	Digital Process
2	VPR-1	Video Signal Processor, A/D, D/A, Ref CK Generator, Composite Encoder	
3	DPR-36	Digital Data Processor (Encode/Decode, Error Correction)	
4	APR-1	Audio Signal Processor (A/D, D/A, AES/EBU I/F)	RF/Analog Process
5	EQ-45A (DVW-A500P)	RF Equalizer (REC Current Cont., PB EQ, Analog Betacam PB Buff)	
	EQ-45 (DVW-500P)	RF Equalizer (REC Current Cont., PB EQ)	
6	CUE-1AP (DVW-A500P)	CUE, TC REC/PB & LAU PB Circuit	
	CUE-1 (DVW-500P)	CUE, TC REC/PB Circuit	
7	AP-28 (DVW-A500P)	AFM Demodulator & LAU Noise Reduction for Analog Betacam (PB)	Analog Betacam Playback
8	DM-89 (DVW-A500P)	RF Demodulator for Analog Betacam (PB)	
9	TBC-24 (DVW-A500P)	TBC (A/D Conversion & Write Clock Gen. Blocks)	
10	TBC-23 (DVW-A500P)	TBC (Sequence & Reference Block)	
11	DEC-65	Analog Composite Decoder (optional accessory BKDW-506)	Option
12	AC-139	AC Connector Board with Breaker	Power
13	SW REG	Switching Regulator	
14	HN-181	Connection Board (Drum, etc) with REC Inhibit Sensor	Connection
15	HN-185	Connection Board with Dew Sensor	
16	HN-184	Connection Board (Threading Motor and END Sensor, etc)	

No.	Board Name	Circuit Function	System Configuration
17	SS-52A (DVW-A500P)	System, Servo, DT Control (with Analog Betacam PB Function)	System/Servo Control
	SS-52 (DVW-500P)	System, Servo, DT Control (without Analog Betacam PB Function)	
18	DR-307/200	Motors (Drum, Reel, Capstan, etc) Driver, Solenoids Driver	
19	DT-34	DT Driver	Front Panel Function
20	FP-58	Panel Function (SWs, LEDs) Control, CAV Control Level Conversion	
21	VR-152	Audio REC Level VRs	
22	VR-153	Audio PB Level VRs	
23	SWC-17	Upper Panel Function (Switches, LEDs)	
24	SWC-18	Sub Control Panel Function	
25	SWC-19	System Set-up Panel Function Control	
26	KY-231	Lower Panel Function Control	
27	DP-176	Time Counter Display	
28	PTC-69	Search Dial Sensor	Rear Panel Function
29	CP-218	Rear Panel Connector Board (Analog Video Signal Buffer)	
30	CP-220	Rear Panel Connector Board (Analog/Digital Audio, TC)	Option
31	RM-130	Parallel (50P) Interface (optional accessory BKDW-509)	
32	MB-441	Mother Board	Other
33	PTC-54	Threading FG	
34	CCM-15	Threading Motor/Reel Shift Motor	
35	TR-79	T Tension Sensor, Thread/Unthread End Sensor	
36	PTC-59	Cassette's Holes Sensor	
37	RM-141	T Reel Motor	
38	RM-82	S Reel Motor	
39	SE-228	Reel FG	
40	PTC-71	Reel Position Sensor	
41	TR-78	S Tension Sensor	
42	PD-35	Pinch Solenoid Connection	Cassette Compartment Driver/Sensor

1-5-3. Function and Location of Sensors

- ① **Threading motor rotation sensor**
The threading motor rotation sensor detects the rotation speed of the threading motor.
The FG output signal of this detection sensor is input to the servo circuit to control the threading speed so that the tape is not damaged during threading and unthreading.
- ② **Threading-end/unthreading-end sensor**
This sensor detects whether the threading ring reaches the threading-end or unthreading-end position.
- ③ **T tension regulator arm sensor**
During recording and playback, this sensor detects the tension arm position and controls the reel torque to keep a constant T tape tension.
- ④ **Condensation sensor**
This sensor detects whether the dew condensation occurs in the unit.
- ⑤ **Tape top sensor**
This sensor detects the top of the tape, and in addition detects the tape end of the tape that runs in the reverse direction.
- ⑥ **Reel hub diameter sensor**
The reel hub diameter of a cassette tape varies depending on the length of the tape wound on the cassette tape. The reel hub diameter sensor detects the reel hub diameter using a tub on the back side of the cassette tape. The output signal of this sensor is input to the servo circuit to control the rotation speed and torque of the reel motor.
- ⑦ **Metal tape sensor**
Using a tub on the back side of the cassette tape, this sensor detects whether an oxide tape or metal tape is being inserted into the unit. (Only during analog tape playback)
- ⑧ **Tape thickness sensor**
Using a tub on the back side of the cassette tape, this sensor detects the thickness of the tape wound on a cassette tape that is being inserted into the unit.
- ⑨ **Analog/digital tape sensor**
Using a tub on the back side of the cassette tape, this sensor detects whether an analog tape or digital tape is being inserted into the unit.

- ⑩ **L cassette REC INHIBIT sensor**
This is a REC inhibit plug detector switch for the digital large cassette.
- ⑪ **T reel table rotation sensor**
This sensor detects the rotation of the take-up reel table. The FG output signal of this sensor is input to the servo circuit to control the rotation speed of the reel motor.
- ⑫ **S reel table rotation sensor**
This sensor detects the rotation of the supply reel table. The FG output signal of this sensor is input to the servo circuit to control the rotation speed of the reel motor.
- ⑬ **Reel L/S position sensor**
This sensor detects whether the reel table moves to the correct position according to the size of the inserted cassette tape.
- ⑭ **S cassette REC INHIBIT sensor**
This is a REC inhibit plug detection switch for the digital small cassette.
- ⑮ **S tension regulator arm sensor**
During recording and playback, this sensor detects the tension arm position and controls the reel torque to keep a constant S tape tension.
- ⑯ **Tape end sensor**
This sensor detects the end of the tape that runs in the forward direction.
- ⑰ **Cassette-in sensor (L)**
This sensor detects whether a cassette is being inserted.
- ⑱ **Cassette L/S size sensor**
This sensor detects whether the inserted cassette tape is an L size or S size.
- ⑲ **Cassette-in sensor (R)**
This sensor detects whether a cassette is being inserted.
- ⑳ **Cassette-down (2) sensor**
The cassette-down (1) sensor detects the movement of the cassette compartment through combined ON/OFF operation of the cassette-down (2) sensor, the cassette-down (1) sensor, and a cassette-in sensor.
- ㉑ **Cassette-down (1) sensor**

1-6. LED INDICATOR INFORMATION ON BOARDS

DIF-16 Board

LED No.	Name	Color	Description	Normal State
D100	DIF TEST YP	Red	Lights when the Y PARITY test mode is executed in the maintenance mode.	Goes off
D101	PARA IN P ERROR	Red	Lights when an error occurs in the video signal that is sent from VPR board to DIF board.	Goes off
D102	TX625/525	Green	Indicates the state of 4: 2: 2 component serial digital interface output. This state is set 625/50 by C.P.U BUS CONTROL.	Goes off
D401	D1 INX ERROR	Red	Lights when no color frame information is contained in a D1 serial signal that is input from the SERIAL V/A INPUT connector.	——
D402	TRS ERROR	Red	Lights when a valid 4: 2: 2 component serial digital signal is not input to the SERIAL V/A INPUT connector.	——
D403	SERIAL IN	Green	Lights when a 4: 2: 2 component serial digital signal is input to the SERIAL V/A INPUT connector.	Goes on
D404	RX625/525	Green	Detects 625/50 and 525/60 automatically for a 4: 2: 2 component serial digital signal that is input from the SERIAL V/A INPUT connector. Lights when 625/50 is detected. However, always lights when no SIF signal is input.	Goes off

DIF-16 Board

LED No.	Name	Color	Description	Normal State
D406	RX TEST ERROR	Red	Lights when an error occurs in the maintenance mode.	Goes off
D417	RX AUDIO EXIST A4	Green	Lights when an AUDIO CH4 signal is detected from the serial digital video/audio input signal.	Goes on
D418	RX AUDIO EXIST A3	Green	Lights when an AUDIO CH3 signal is detected from the serial digital video/audio input signal.	Goes on
D419	RX AUDIO EXIST A2	Green	Lights when an AUDIO CH2 signal is detected from the serial digital video/audio input signal.	Goes on
D420	RX AUDIO EXIST A1	Green	Lights when an AUDIO CH1 signal is detected from the serial digital video/audio input signal.	Goes on
D421	RX AUDIO ERROR A4	Red	Lights when an error occurs in the AUDIO CH4 signal detected from a serial digital video/audio input signal or when the AUDIO CH4 signal cannot be received normally.	Goes off
D422	RX AUDIO ERROR A3	Red	Lights when an error occurs in the AUDIO CH3 signal detected from a serial digital video/audio input signal or when the AUDIO CH3 signal cannot be received normally.	Goes off
D423	RX AUDIO ERROR A2	Red	Lights when an error occurs in the AUDIO CH2 signal detected from a serial digital video/audio input signal or when the AUDIO CH2 signal cannot be received normally.	Goes off
D424	RX AUDIO ERROR A1	Red	Lights when an error occurs in the AUDIO CH1 signal detected from a serial digital video/audio input signal or when the AUDIO CH1 signal cannot be received normally.	Goes off
*D507	ENC1 ADJUST	Green	Lights when the VCO frequency is almost 27 MHz adjusting the D1 ENC1 VCO in the maintenance mode A23 : DIF VR.	Unsettled
*D508	ENC2 ADJUST	Green	Lights when the VCO frequency is almost 27 MHz adjusting the D1 ENC2 VCO in the maintenance mode A23 : DIF VR.	Unsettled
*D509	DEC ADJUST	Green	Lights when the VCO frequency is almost 27 MHz adjusting the D1 DEC VCO in the maintenance mode A23 : DIF VR.	Unsettled

SS-52 Board

LED No.	Name	Color	Description	Normal State
D300	——	——	Unused	——
D301	SYS 1	Amber	Blinks during SYS 1 V25 CPU normal operation.	Blinks
D601	SYS 2	Amber	Blinks during SYS 2 Z80 CPU normal operation.	Blinks
D711	SV	Amber	Checks the ROM and RAM for communication when the power switch is set to ON. Lights for scores ms at intervals 1 to 2 seconds. (For the blinking pattern when abnormality occurred, refer to the figure shown right.)	Blinks
D800	DRUM	Amber	Blinks during drum microcomputer normal operation. Usually lights for 30 msecond at intervals of about one second. The blinking interval is inverted when the drum is locked.	Blinks
D2109	DT	Amber	Blinks during DT microcomputer FMC-16 CPU normal operation.	Blinks

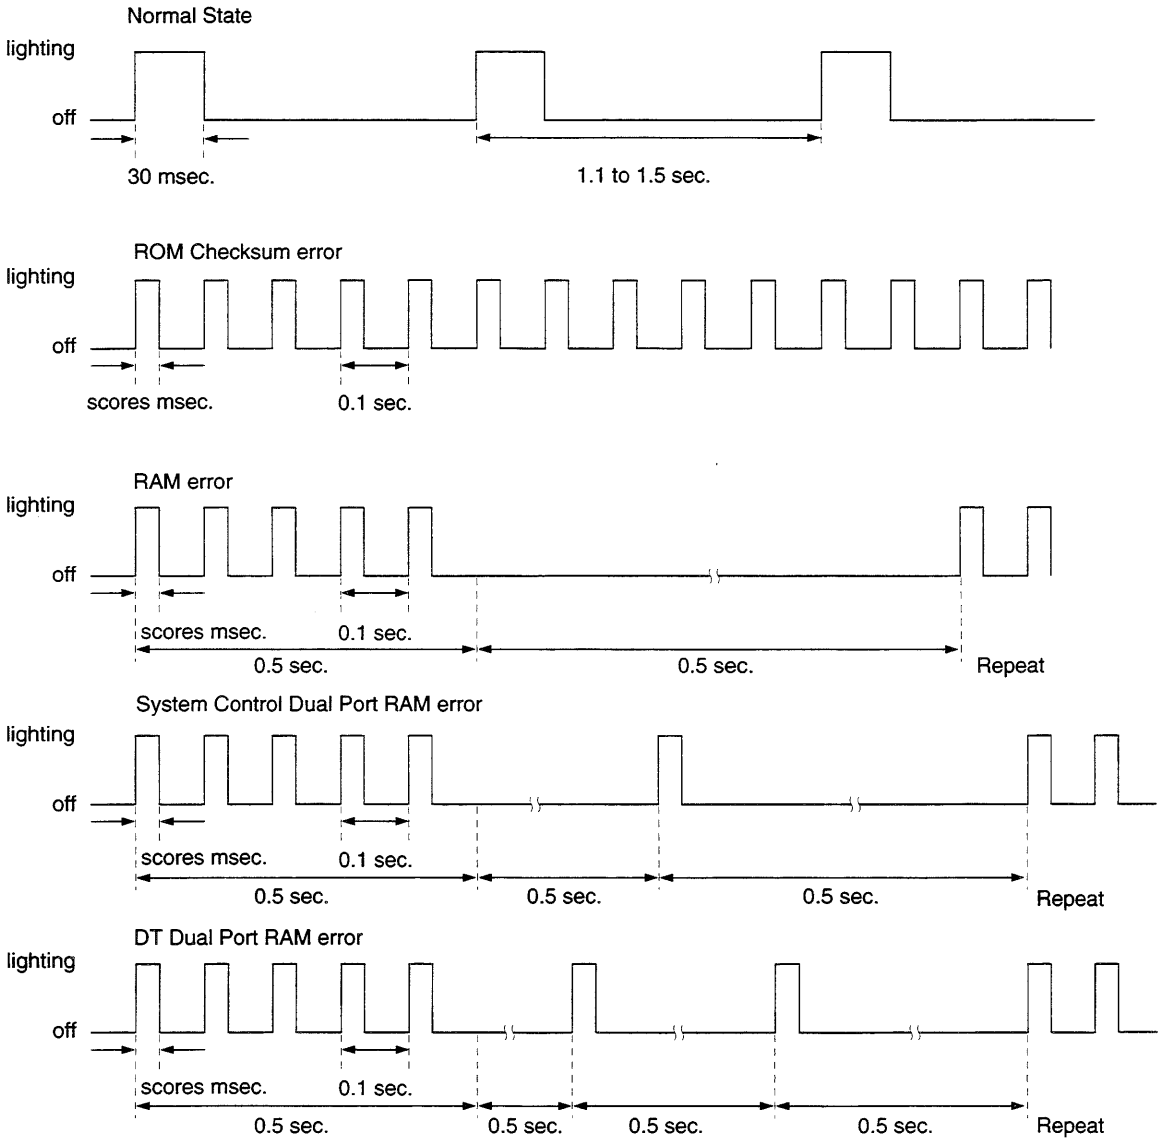

* : Lot No. 907 and higher

APR-1 Board

LED No.	Name	Color	Description	Normal State
D51	APR 1	Amber **Red	Blinks during APR 1 microcomputer normal operation (when a 1/2VD signal is received from the SS-52 board).	Blinks

** : Lot No. 910 and higher

<Blinking Pattern of D711 on SS-51 Board>

TBC-23 BOARD

DM-89 BOARD

DM-89 Board (for DVW-A500P)

LED No.	Name	Color	Description	Normal State
D902	ADJUST	Amber	Usually lights for about 10 msec at intervals of about one second. The blinking interval is inverted when the unit is in the adjustment mode (when switch S901-1 is set to ON).	Blinks

TBC-23 Board (for DVW-A500P)

LED No.	Name	Color	Description	Normal State
D200	TBC	Amber	Lights once a second during TBC microcomputer normal operation.	Blinks

1-7. MECHANISM OF CASSETTE

As shown in the figure below, plugs and tabs are provided at the back side of the cassette tape.

Analog cassette tape

- ① S cassette REC inhibit tab (for oxide tape)
- ② Video tape thickness detection tab
- ③ Metal tape detection tab
- ④ Reel hub diameter detection tab
- ⑤ S cassette REC inhibit plug (for metal particle tape)
- ⑥ L cassette REC inhibit plug

Digital cassette tape

- ⑦ S cassette analog REC inhibit plug (originally open)
- ⑧ Video tape thickness detection tab
- ⑨ SPARE ID
- ⑩ Digital tape detection hole
- ⑪ SPARE ID
- ⑫ Reel hub diameter detection tab
- ⑬ S cassette digital REC inhibit plug
- ⑭ L cassette digital REC inhibit plug
- ⑮ L cassette analog REC inhibit plug (originally open)

Fig 1.

Fig 2.

The presence or absence of these plugs and tabs determines the cassette status as shown in the table below.

Analog cassette tape

No.	Plug and tab	Cassette status with or without plugs and tabs	
		With plugs and tabs	Without plugs and tabs
①	S cassette REC inhibit tab (for oxide tape)	Can be recorded (refer to Fig. 1).	Cannot be recorded (refer to Fig. 2).
②	Video tape thickness detection tab	A 20 μm thick tape is wound on the cassette.	A 15 μm thick tape is wound on the cassette.
③	Metal tape detection tab	An oxide tape is wound on the cassette.	A metal tape is wound on the cassette.
④	Reel hub diameter detection tab	For small hub	For large hub
⑤	S cassette REC inhibit plug (for metal particle tape)	Can be recorded (refer to Fig. 1).	Cannot be recorded (refer to Fig. 2).
⑥	L cassette REC inhibit plug		

Digital cassette tape

No.	Plug and tab	Cassette status with or without plugs and tabs	
		With plugs and tabs	Without plugs and tabs
⑦	S cassette analog REC inhibit plug (originally open)	_____	Analog signals cannot be recorded.
⑧	Video tape thickness detection tab	_____	A 14 μm thick tape is wound on the cassette.
⑨	SPARE ID	_____	_____
⑩	Digital tape detection hole	An analog tape is wound on the cassette.	A digital tape is wound on the cassette.
⑪	SPARE ID	_____	_____
⑫	Reel hub diameter detection tab	For small hub	For large hub
⑬	S cassette digital REC inhibit plug	Can be recorded (refer to Fig. 1).	Cannot be recorded (refer to Fig. 2).
⑭	L cassette digital REC inhibit plug	Can be recorded (refer to Fig. 1).	Cannot be recorded (refer to Fig. 2).
⑮	L cassette analog REC inhibit plug (originally open)	_____	Analog signals cannot be recorded.

1-8. HOW TO PULL OUT/PUSH IN LOWER CONTROL PANEL

1. Take both side handles of a lower control panel and pull them slightly forward. Pull them more strongly, then the lower control panel is fixed.
2. Lift the lower control panel. The panel can be moves maximum 90 degrees.

NOTE

The lower control panel can be tilted up to 90 degrees by approximately 15 degree step. When using the lower control panel on the tilt, turn the knobs clockwise to hold the panel firmly.

3. When put back the panel assembly in the unit, replace it horizontally to the front side of the unit and then push it in the unit.

NOTE

Put back the panel assembly in the unit surely after using the unit.

Pulling out/Pushing in the Lower Control Panel

1-9. REMOVAL/INSTALLATION OF LOWER CONTROL PANEL ASSEMBLY

Removal

1. Fix a lower control panel at 90 degrees.
(Refer to Sec. 1-8. How to Pull out/Push in the Lower Control Panel)
2. Disconnect the connector (CN580) on the system set-up panel.
3. Loosen the two black screws on the lower control panel assembly. (Loosen the screws until screw's top are exposed from the lack of the lower control panel assembly.)

Disconnecting the Connector

1-9. REMOVAL/INSTALLATION OF LOWER CONTROL PANEL ASSEMBLY

4. While pushing the loosen black screws in the direction of the arrow, remove the lower control panel assembly from the arms.

Removal of the Panel Assembly

Installation

5. Connect the harness of the panel assembly to the connector (CN580) on the system set-up panel.
6. Fix the arms at 45 degrees.
7. Set the notches of the panel assembly to the claws of the arms and insert the panel assembly until making a click sound.
Then fix the assembly with the two screws.
8. When putting back the panel assembly in the unit, replace it horizontally to the front side of the unit and then push it in the unit.

Installation of the Panel Assembly

1-10. HOW TO TAKE OUT THE CASSETTE WHEN THE TAPE IS SLACKING

When the tape is slacked in the VTR, take out the cassette tape in the procedure below while taking care not to damage the tape.

1. Turn off the POWER.
2. Remove the upper lid.
(Refer to Section 1-2. Removal/Installation of Cabinet.)
3. Remove the plate MD.
(Refer to Section 1-3. Removal/Installation of Plate MD.)
4. Rotate the rotation detection pulley of the threading motor block in the direction of the arrow with fingers by about a half turn and slacken the tape.
5. Shift the ME lever toward the front panel and wind the tape inside the cassette.

NOTE

Do not shift the ME lever during normal operation (during reel table operation).

Repeat steps 4 and 5 until the unit is put into the unthreading-end state and until the tape is wound completely.

6. Fix the lower control panel assembly at the position of 90 degrees.
(Refer to Section 1-8. How to Pull out/Push in Lower Control Panel.)

Winding of a Tape

7. Turn the yellow pulley of the cassette compartment motor shown in the figure clockwise until the cassette tape is ejected completely.

Ejection of a Cassette Tape

1-11. CLEANING WHEN THE HEADS ARE CLOGGED

If the video heads are clogged, clean the heads as the following procedure.

If the video heads are clogged after cleaning by cleaning tape, clean them by cleaning piece.

1-11-1. Cleaning by Cleaning Tape

NOTE

Make sure to use the cleaning tape BCT-5CLN. If the cleaning is performed by other cleaning tape, not the BCT-5CLN, unusual friction or damage of the video head may occur.

1. Insert the cleaning tape BCT-5CLN in the unit.
2. Press the EJECT button simultaneously with PLAY button.
Head cleaning starts.
3. After 5 seconds, the cleaning tape will be ejected automatically.

NOTE

Be sure to eject the cleaning tape after cleaning to avoid damages to the heads.

4. Confirm that the head clog is clear.

1-11-2. Cleaning by Cleaning Cloth

Caution

- Turn the power off before cleaning.
- Each block in the mechanical deck consists of a precision part and is adjusted precisely. Be careful not to damage each part and to apply an excessive force during cleaning.
- Do not touch the greased portions during cleaning. If grease attaches to a cleaning cloth, replace the cleaning cloth by new one. If a cleaning cloth smeared with grease is used, grease may attach to the places where it should not.
- Do not insert a cassette tape before a cleaning fluid completely evaporates after cleaning.

Tools

- Cleaning cloth: 3-184-527-01
- Cleaning fluid: 9-919-573-01

Caution

Do not use a cotton swab to clean the rotary heads.

Procedures

1. Turn the power off.
2. Remove the upper lid.
(Refer to Section 1-2-1.)
3. Remove the plate MD.
(Refer to Section 1-3.)
4. Remove the cassette compartment.
(Refer to Section 1-2-2.)
5. Loosen the two screws and remove the upper drum cover.

NOTE

These screws cannot be removed because of stoppers.

Removal/Installation of Upper Drum Cover

6. Press the cleaning cloth moistened with cleaning fluid slightly against the rotary heads.
7. Rotate the inner drum slowly counterclockwise two or three turns and clean the rotary heads.

Caution

Be sure to rotate the inner drum counterclockwise and clean the rotary heads along the circumference. Do not rotate the inner drum in the direction opposite to the specified direction (clockwise) or clean it in the vertical direction. This may damage the rotary heads.

8. After cleaning, wipe it with a dry cleaning cloth two or three times.
9. Tighten the two screws while pressing the upper drum cover towards the drum support direction.

Tightening torque: $14.7 \times 10^{-2} \text{ N} \cdot \text{m}$ (1.5 Kgf·cm)

Cleaning by Cleaning Cloth

1-12. HOW TO START THE FUNCTIONS EXPANDED BY THE SETUP MENU SETTING

1-12-1. How to Start the Internal Video SG

1. Select the signal you wish to output in Setup Menu "ITEM 710: INTERNAL SIGNAL GENERATOR".
2. When the VIDEO INPUT SELECT button on the upper control panel that lights currently is continuously pressed for more than three seconds, a video input signal is switched to the internal video SG. (When the internal video SG is started, all the VIDEO INPUT SELECT buttons light.)
3. To cancel the internal video SG, perform step (a) or (b) below.
 - (a) Press one of the VIDEO INPUT SELECT buttons.
 - (b) Change the setting of Setup Menu "ITEM 710: INTERNAL SIGNAL GENERATOR" to "DATA NO.00: OFF". And simultaneously, a video input signal is switched to the signal that has been selected before the internal video SG is started.

1-12-2. How to Start the Internal Audio SG

1. Select the signal you wish to output in Setup Menu "ITEM 808: INTERNAL AUDIO SIGNAL GENERATOR".
2. Press the INPUT SELECT button on the upper control panel to turn it lighted (to enter the AUDIO INPUT SELECT mode).
3. When one of the CH1 AUDIO INPUT SELECT buttons (SIF, AES/EBU L, ANALOG R) is continuously pressed for more than three seconds, the digital audio input signals in all channels are switched to the internal audio SG. (When the internal audio SG is started, the AUDIO INPUT SELECT buttons in all channels light.)

Even if the unit is put into the MONITOR SELECT mode (the MONITOR SELECT button is pressed to turned lighted) during internal audio SG start, the INPUT SELECT button continues lighting.

(The unit is put into the MONITOR SELECT mode if the MONITOR SELECT button is pressed when the internal audio SG is not started. At that time, the MONITOR SELECT button lights and the INPUT SELECT button goes off.)

4. To cancel the internal audio SG, perform step (a) or (b) below.
 - (a) Press one of the CH1 to CH4 AUDIO INPUT SELECT buttons on the lower control panel in INPUT SELECT mode (Press the INPUT SELECT button so that the MONITOR SELECT button goes off.). And simultaneously, an audio input signal is switched to the signal according to the selected button at this time.
 - (b) Change the setting of Setup Menu "ITEM 808: INTERNAL AUDIO SIGNAL GENERATOR" to "DATA NO.00: OFF". And simultaneously, an audio input signal is switched to the signal that has been selected before the internal audio SG is started.

1-12-3. How to Start the System E-E Mode

NOTE

While the REC INHIBIT lamp is lighted on the lower control panel, the system E-E mode can not be started.

1. Select the signal path when the system E-E function is valid in setup menu "ITEM 902: SYSTEM EE MODE".
2. Press the STOP button on the lower control panel.
3. The system E-E mode is valid only when the DELETE and REC buttons are pressed on the lower control panel at the same time. (If the DELETE and REC buttons are released, the unit enters the normal E-E mode with the REC button lighted.)
4. To cancel the system E-E mode, change setting of setup menu "ITEM -902: SYSTEM EE MODE" to "DATA No. 0: off".

1-13. FIXTURE AND MEASURING EQUIPMENT FOR ADJUSTMENT

1-13-2. MEASURING EQUIPMENT

It is recommended to use the measuring equipments listed below or the equivalents.
Each equipment is available as a standard product.

Equipment	Model Name	Remarks
Analog Composite Signal Generator	SONY TEKTRONIX 1411	for VPR-1 board alignment
	SONY TEKTRONIX TSG-271A	
Analog Component Signal Generator	SONY TEKTRONIX TSG-300 or TSG-371	for generating SMPTE/EBU format analog signals
Digital Component Signal Generator	SONY TEKTRONIX TSG-422(OP.1S)	for generating 4:2:2 format digital signals
Spectrum Analyzer	ADVANTEST R3261A	with external trigger function bandwidth: more than 100 MHz
Oscilloscope	SONY TEKTRONIX 2465B	
Component/Composite Wave Form Monitor	SONY TEKTRONIX WFM 300A	for measuring video levels
Wave Form/Vector Monitor	SONY TEKTRONIX 1751 or 1781R	for measuring analog composite SCH
Audio Level Meter	HEWLETT PACKARD HP3400A	
Audio Analyzer	SONY TEKTRONIX AA501A(OP.02)	for measuring distortion and levels
Audio Generator	SONY TEKTRONIX SG505(OP.02)	
Frequency Counter	ADVANTEST TR5821AK	
Digital Voltmeter	ADVANTEST TR6845	
Monitor with Serial Digital Input	SONY BVM-1410 (with optional accessory BKM-2085-14)	
Network Analyzer	ANRITSU MS-420B

1-14. ERROR LOGGER FUNCTION

- CH COND RED (Channel Condition Red)
When the red CHANNEL CONDITION Lamp on the upper control panel lights;
- REF ALARM (Reference Alarm)
When a reference signal is missing (no signal is input to the INPUT REF VIDEO terminal) or a REF video input signal is not synchronized with the input video signal;
- TAPE EJECT
When the cassette tape is ejected;
(If no error is occurred from when the cassette tape was ejected last time until it is ejected this time, the preceding time code is overwritten by this time code.)
- ERROR-xx
When a trouble is detected;
(The corresponding error code is recorded.)

When any one of the conditions mentioned above occurs, the corresponding message and time code are stored. After the power switch is turned on, the error logger function always monitors the unit to detect the errors. The contents of these data items can be read and checked in the form of a list.

Error Logger Screen

To enter the error logger screen, press the MENU button while pressing and holding the ENTRY button on the lower control panel.
The error logger data is superimposed on the monitor screen (output to the VIDEO OUTPUT COMPOSITE 3 connector or SERIAL V/A OUTPUT 4 connector). Moreover, the time counter on the lower control panel displays the error logger data by only the number of storage error times.
A maximum of 99 error data items can be stored. To display the error data items that are not displayed on the screen, turn the search dial to scroll up them. When 99 data items are exceeded, the old data is erased and the data sequence is advanced.
To exit the error logger screen, press the MENU button on the lower control panel.

Time counter display

NUMBER OF ERROR LOG TOTAL TIMES

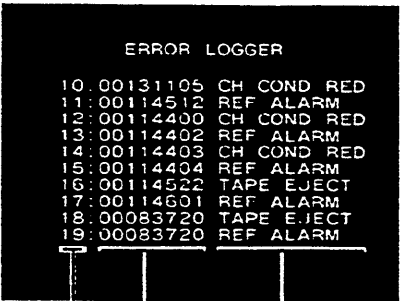

Tape Operation during Error Logger Screen Display

With the error logger screen displayed, press the SET button on the lower control panel to display a block sign on the monitor screen. This enables the tape operation.
To return to the error logger screen, press the MENU button on the lower control panel.

Error Logger Data Erasure

To erase the error logger data, press the RESET button on the lower control panel in the error logger screen display.

1-15. SAFETY CHECK-OUT

After correcting the original service problem, perform the following safety checks before releasing the unit to the customer:

Check the metal trim, "metallized" knobs, screws, and all other exposed metal parts for AC leakage. Check leakage as described below.

LEAKAGE TEST

AC leakage from any exposed metal part to earth ground and from all exposed metal parts to any exposed metal part having a return to chassis must not exceed 3.5 mA. Leakage current can be measured by any one of three methods.

- (1) A commercial leakage tester, such as the Simpson 229 or RCA WT-540A. Follow the manufacturers' instructions to use these instruments.
- (2) A battery-operated AC milliammeter. The Data Precision 245 digital multimeter is suitable for this job.
- (3) Measuring the voltage drop across a resistor by means of a VOM or battery-operated AC voltmeter. The "limit" indication is 5.25V; therefore, analog meters must have an accurate low-voltage scale. The Simpson 250 and Sanwa SH-63Trd are examples of a passive VOM that is suitable. Nearly all battery operated digital multimeters that have a 20V AC range are suitable. (Refer to Fig. A)

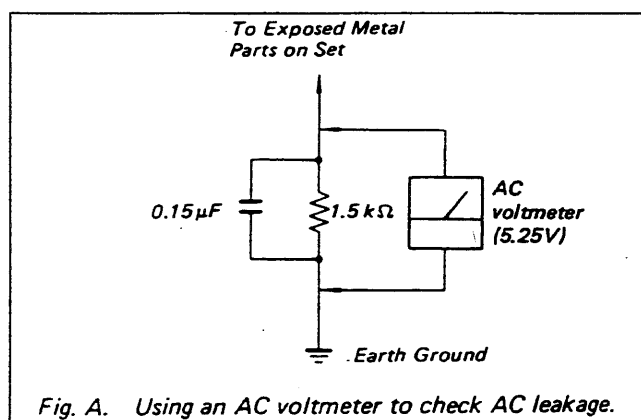

Fig. A. Using an AC voltmeter to check AC leakage.

SECTION 2

RECORDING FORMAT, HEAD CONFIGURATION, AND SIGNAL PROCESSING

2-1. OUTLINE

This Sony DVW series VTR is a 1/2-inch component digital VTR which uses a new "Digital Betacam" format.

This "Digital Betacam" format has been developed as the digital version of the analog Betacam format that has been now accepted as a standard in the broadcasting, production, and Electronic News Gathering (ENG) fields of the world.

That is, the Digital Betacam VTR can perform high-performance digital recording and playback while keeping the playback compatibility of the conventional analog Betacam tape, and has almost the same operation performance as in the conventional analog Betacam VTR.

To perform such a workhorse VTR, a new bit rate reduction format (i.e., coefficient recording) has been developed. The data rate is compressed into approximately 1/2, and compressed data is recorded on tape. Moreover, the introduction of a high-performance, high-precision heads and drum, and a new automatic tracking system has enabled a drastic reduction of the width of the recording track.

As the result, the Digital Betacam VTR is able to use the same size 1/2-inch Digital Betacam cassette (S and L) as in the conventional Betacam cassette. The L cassette makes continuous recording of more than 120 minutes possible.

In the DVW-A500P, the analog tape (metal and oxide) recorded based on the Betacam/Betacam SP format can also be played back. Therefore, currently-owned Betacam recorded tapes can also be used directly. Furthermore, an analog Betacam SP VTR (especially Camcorder) can also be jointly used in the Digital Betacam system.

2-2. RECORDING FORMAT

2-2-1. Tape Pattern

Fig. 2-2-1 shows the tape pattern in the 625/50 system. To explain the operation of the recorder (DVW-A500P) with a Betacam playback function, this figure shows the tape pattern of the Digital Betacam format at right, and the tape pattern of the Betacam SP format at left together.

In the Digital Betacam format, one-field video data is recorded on six helical tracks (program tracks). In other words, since one-field data is recorded while the drum rotates by 1.5, the number of drum rotations is 75 per second. In the Betacam SP format, since one-field data is recorded while the drum rotates by 1/2, the number of drum rotations is 25 per second. As shown in the figure, the tape speed of the Digital Betacam format is lower about 5% than that of the Betacam SP format.

The DVW-A500P detects whether the cassette tape to be played back is based on the Digital Betacam format or the analog Betacam format, by the ID hole of the cassette, and switches the control mode automatically. As the result, the tape is played back at the same drum rotation and tape speed as when it is recorded, and parameters are set so that the optimum tracking is obtained.

The drum diameter of the Digital Betacam VTR is larger about 9% than that of the Betacam SP VTR. Since the relative speed of the head to tape increases proportionally to the drum diameter even if the drum rotation is made same, the signal recorded on the helical track of the Betacam SP tape is played back as time-compressed signal about 9%. In other words, the frequency of the played back RF signal increases. However, the RF signal is processed by a signal processing circuit in the later stage so that it can obtain the same performance as before.

The tape pattern of the Digital Betacam format has three longitudinal tracks (i.e., control track, time code track, and cue audio track). These tracks coincide with the tape pattern of the Betacam SP format. Therefore, the longitudinal tracks of the Betacam SP tape can be played back by the stationary heads of the Digital Betacam VTR. In the Betacam SP format, however, the fourth longitudinal track that records an audio CH1 signal is provided in parallel. The VTR with a Betacam playback function thus has a two-channel audio head.

Fig. 2-2-1. Tape Pattern (625/50)

2-2-2. Data Arrangement on Program Tracks

Fig. 2-2-2 shows the arrangement of data recorded on helical tracks (program tracks). The size of each section in the figure is not the actual dimension ratio. For more information on the size, refer to Fig. 2-2-1.

The Digital Betacam format uses an azimuth recording system to perform high-density recording. Namely, two heads with an azimuth angle of approximately 15 degrees in the opposite direction to each other are paired to record two program tracks (track 0 and 1) while the drum rotates by 1/2. One-field video data and audio data are recorded on six program tracks. Fig. 2-2-2 shows the arrangement of one-frame data. Field 1 data is recorded on the first-half six tracks, and field 2 data is recorded on the latter-half six tracks.

Each program track is constructed to have four audio sectors in the center and to have two video sectors beyond the tracking pilot signals put before and behind the audio sectors. In other words, one-field video data is dispersed into twelve video sectors for recording, and four-channel audio data is dispersed into six audio sectors for recording for every channel. As shown in Fig. 2-2-2, each channel for the audio sectors is arranged so that the danger of error generation disperses.

To identify the beginning and end of a sector, preamble and postamble data are added before and behind all the sectors. Also, edit gaps are installed between the sectors so that each channel can be edited independently.

Tracking pilot signals are used in an automatic tracking system that secures high-speed and high-precision tracking during editing.

Fig. 2-2-2. Data Arrangement on Program Tracks

2-2-3. Longitudinal Tracks

As shown in Fig. 2-2-1, a control track, time code track, and cue audio track are provided in the longitudinal direction of the tape.

Fig. 2-2-3 shows the CTL signal and time code signal in the 625/50 system, and the timing relationship between these signals and video reference signals.

The CTL signal is recorded by a 50-Hz rectangular pulse in the 625/50 system and controls the start timing of each field data at the rising edge of the pulse. The CTL signal is also modulated the duty cycle of the rectangular wave to 65 : 35 in the first field of a color frame and modulated it to 35 : 65 in the fifth field so as to identify the field number and control the color framing.

The time code signal uses a conventional longitudinal time code based on the EBU standard. One frame consists of 80 bits. Frame number, second, minute, hour, and sync word data items are coded by a biphasic mark coding method and recorded for every frame. A user bit is written in the time data as a binary group.

The cue audio signal is recorded by an ordinary AC bias method.

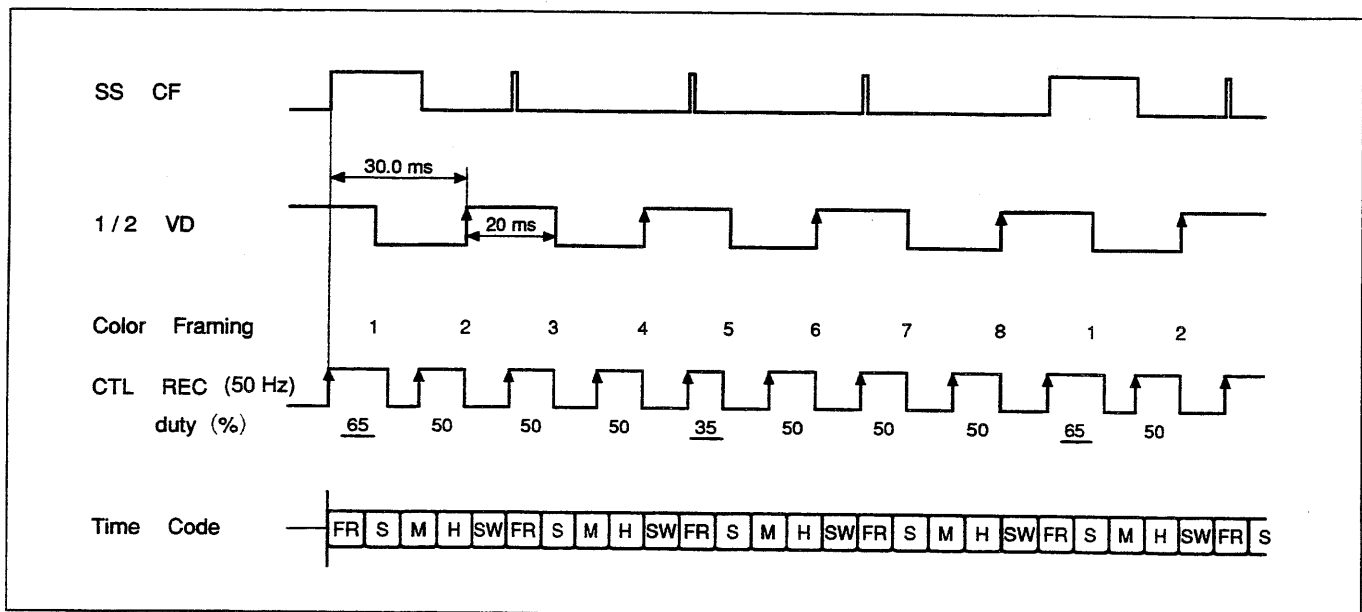

Fig. 2-2-3. Digital Betacam Timing Chart (625/50)

2-3. HEAD CONFIGURATION

Fig. 2-3-1 shows the arrangement of the stationary and rotary heads in the DVW-A500P, and its top view. However, the rotary heads can be actually viewed only their tips from the side of the drum.

In the illustration that shows the rotary heads, ADVANCE heads and Y/C heads installed in pairs on the square plates like the bimorph plates are dynamic tracking heads. These heads are used to play back a digital tape and an analog tape respectively. Therefore, the model (DVW-500P for a recorder) without a Betacam playback function has no Y/C heads.

Both ADVANCE heads and CONFIDENCE heads are used to play back a digital tape. In usual PB mode, the ADVANCE heads are used to play back. In the REC and INSERT modes, the ADVANCE heads play back the signal before erasure as preread, and the CONFIDENCE heads play back a recorded signal to confirm that the signal has been recorded. For that purpose, the ADVANCE heads and the CONFIDENCE heads are installed in the specified height on the rotary drum so that they can trace the before track and after track respectively toward the REC head.

Fig. 2-3-1. Arrangement of Stationary and Rotary Heads (DVW-A500P)

2-4. SIGNAL PROCESSING

2-4-1. Outline of the Digital Interface Format

The interface of the Sony Digital Betacam VTR is based on the component serial digital interface format EBU Tech 3267/CCIR-656 Part III. The digital audio interface is based on the AES/EBU format.

1. Serial video interface

Each data of a digital component video signal and four-channel digital audio signal is serialized and can be transmitted over a long distance of more than 200 m using one coaxial cable. The transmission rate is 270M bits per second.

This serial interface uses an S-NRZI (Scrambled Non-return to Zero Inversion) channel code system for digital data coding. The NRZI transmission has a merit that the contents of data do not change even if a signal is inverted in polarity. Therefore, this system has the advantage that a spurious radiation can be reduced by using the positive/negative polarity simultaneously for serial signal transmission or that the IC can be constituted by a stable, low-power consumption differential amplifier. Scramble processing also enables a clock to be reproduced on the receiving side even if data "0" continues.

Video data is processed in conformity with the CCIR-601 standard. The luminance signal (Y) is sampled in 13.5 MHz, and the color-difference signals (CR and CB) are sampled in 6.75 MHz. The luminance signal and color-difference signals are then multiplexed in the order of "CB, Y, CR, Y, CB, Y, CR, Y, ..." and transmitted at the rate of 27M words per second.

Fig. 2-4-1 shows the relationship between the video signal level and the quantizing level. Fig. 2-4-2 shows the sampling format in a horizontal line, and Fig. 2-4-3 shows the sampling format in a field.

As shown in Fig. 2-4-2, the four-word timing reference signals (TRS) are added before and behind the digital active line. The top TRS signal defines the start of the active line and is called an SAV (Start of Active Video). The last TRS signal defines the end of the active line and is called an EAV (End of Active Video).

Fig. 2-4-4 shows the format of a timing reference signal corresponding to 10 bits. Since the first three words of four words constitute a unique pattern of 3FF, 000, and 000 (HEX), they can be detected as a sync word. For serial transmission, when this sync word is detected, the bit to be sent next is judged to be an LSB, and becomes a reference for converting the serial bits into every 10 bits of parallel words. The fourth word (XYZ) defines the field status, and vertical and horizontal blanking timing.

2. Digital audio interface

The digital audio interface is classified into the serial digital interface combined with a video signal and the AES/EBU digital interface employing an XLR connector.

In both interfaces, the digital audio data is based on the AES/EBU format, and corresponds with 48 kHz sampling and 20-bit linear quantizing. For the serial digital interface, the digital audio data is inserted into an auxiliary data area during horizontal and vertical blanking periods. For the AES/EBU digital interface, two channels of audio data are multiplexed and stored in a data frame for every audio-sampling period. One frame consists of two subframes. The left channel data in the stereo mode enters into subframe A, and the right channel data enters into subframe B.

Fig. 2-4-5 shows the format of frame and subframes. The subframes contain various data items (shown in the figure) as well as audio data and consist of 32 bits.

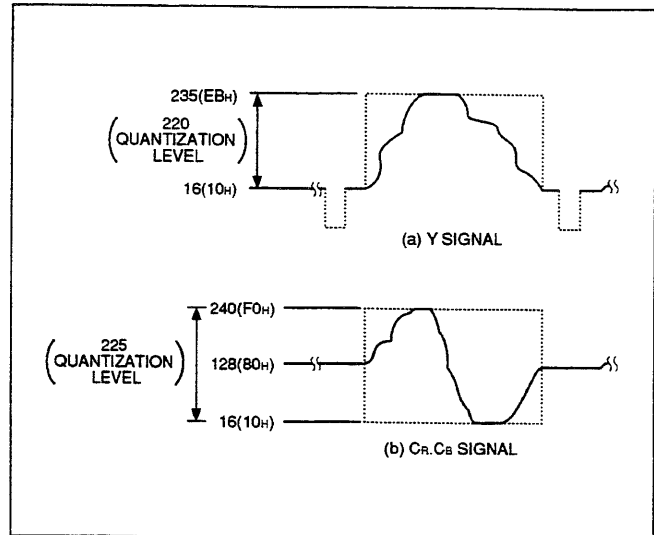

Fig. 2-4-1. Relationship between Video Signal Levels and Quantizing Levels

Definition of (XYZ):

- B9 (MSB): Always 1 except for TRS
- B8: 0: 1st field; 1: 2nd field
- B7: 1: V blanking
- B6: 1: H blanking
- B5, B4, B3, B2: Redundant bits used to correct errors occur in F, V and H.
- B1, B0 (LSB): Always 0 except for TRS

Fig. 2-4-4. Timing Reference Signal (625/50)

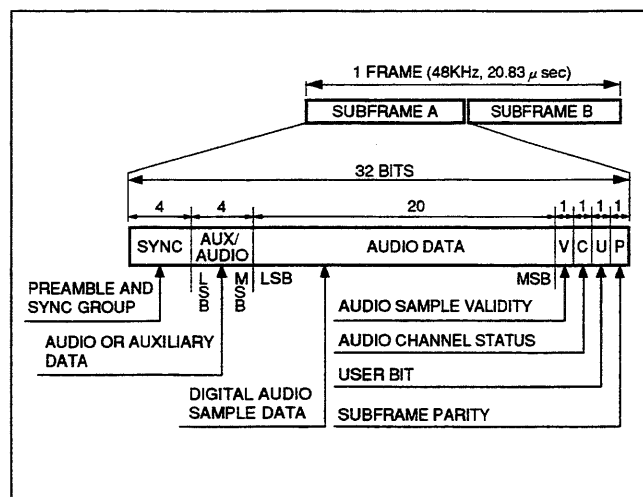

Fig. 2-4-5. Frame and Subframe Formats

2-4-2. Outline of the Digital Signal Processing

The digital signal processing of the Sony Digital Betacam VTR conforms to the D-1 format except that the bit rate reduction processing is added.

Fig. 2-4-6 shows the block diagram of the recording system, and Fig. 2-4-7 shows the block diagram of the playback system.

1. Outline of the recording system

(a) Input interface

For the analog or digital video/audio input signals, the video signal is converted into parallel video data, and the audio signal into serial audio data.

(b) Bit rate reduction encoder

The video data is blocked after it is field-shuffled, then compressed into a data rate of approximate 1/2 according to the newly developed bit rate reduction format.

(c) Audio data processor

The audio data processor performs the audio data selection, gain control, REC verification, and other data processing.

(d) ECC encoder

The ECC encoder performs the error correction coding for error correction in a playback system. The video data that has been sent after bit rate reduction is added the outer error collection code (ECC) and track-interleaved. The audio data sent from the processor is also added the outer ECC and field-shuffled.

Then, the video data and audio data are multiplexed, added the ID data, and inner ECC encoded. Sync data is also added to the resultant data.

(e) REC driver

The REC driver converts parallel REC data into serial data and sends a channel-encoded REC current to the head.

2. Outline of the playback system

In the playback system, signals are processed in the procedure opposite to the recording system.

The audio data error that couldn't be corrected using inner and outer error correction codes is concealed before the audio data is output from an ECC decoder. The video data error that couldn't be corrected is concealed after the video data is returned to the former video data.

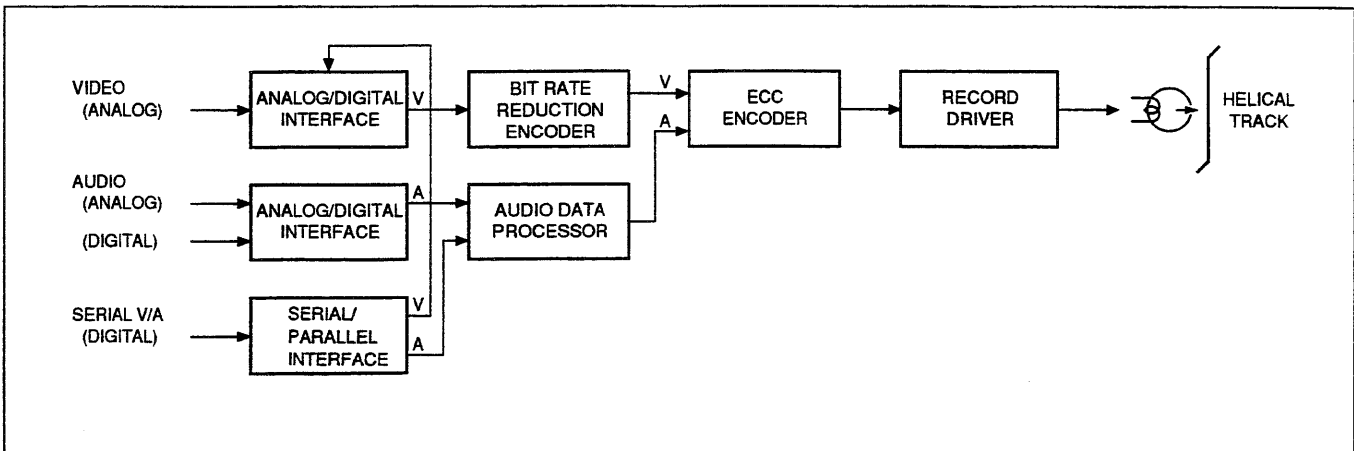

Fig. 2-4-6. Digital Signal Recording System

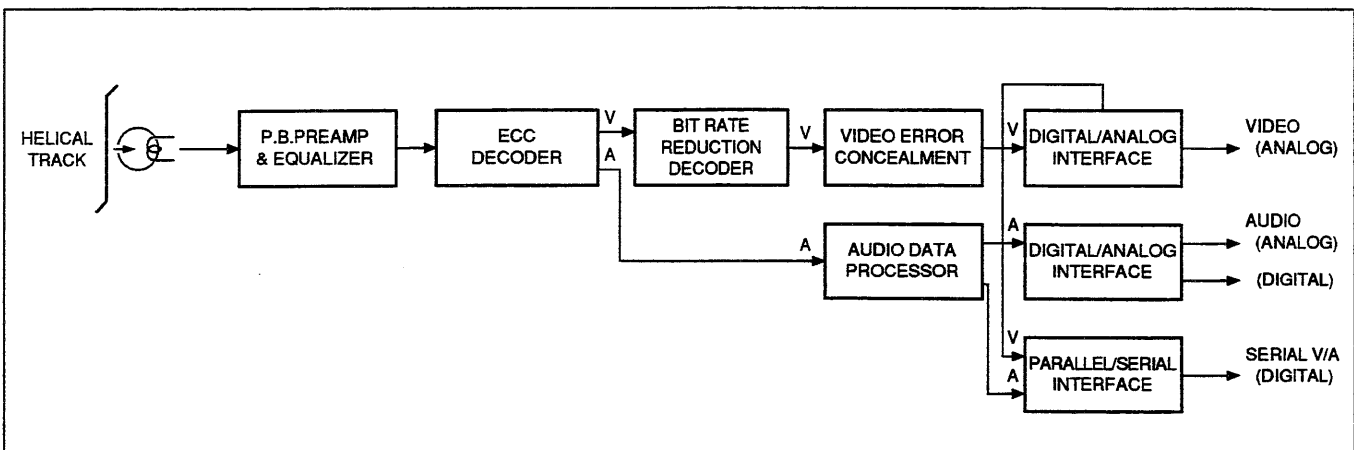

Fig. 2-4-7. Digital Signal Playback System

2-4-3. Error Correction Coding

In the Sony Digital Betacam format, error correction takes place by means of a two-dimensional product code of the inner and outer codes using the Reed-Solomon code.

The structure of the inner code block that constitutes an ECC block is common in video and audio systems. However, the structure of the outer code block differs in video and audio systems. A data block of 180 bytes obtained when sync data is added to one inner code block data is called a sync block, which is the basic unit of a video sector and audio sector. Fig. 2-4-8 shows the structure of the ECC blocks and sync block in the 625/50 system.

One video sector consists of 126 sync blocks. In other words, one video ECC block constitutes one video sector.

Therefore, the two ECC blocks shown in the figure below are recorded on one track, and one field corresponds to 12 ECC blocks.

One audio sector consists of six sync blocks. For the audio data in one channel, one field consists of six sectors (i.e., 36 sync blocks). Therefore, the two ECC blocks shown in the figure correspond to one field in one audio channel.

Fig. 2-4-8. Structure of ECC Blocks and Sync Block (625/50)

3-1. OVERALL

3-2. CIRCUIT BLOCK

[CIRCUIT DESCRIPTION OF VPR-1 BOARD]

VPR-1 board is a video processor board that converts the input video signal into digital data, converts the playback digital data into a video signal, and generates timing reference signals for video/audio processing.

The recording process is described below.

For the video input, a component video signal is the standard analog signal, and a Serial V/A signal is the standard digital signal.

An analog composite signal can also be input using the optional "BKDW-505(NTSC)/506(PAL)" (DEC-65 board).

The component video signal is input to VPR-1 board, where Y, R-Y, and B-Y signals are converted each from analog to digital, passed through a digital filter, where converted into 10-bit parallel data, and sent to the TBC IC (IC307).

In this case, the R-Y and B-Y signals are multiplexed in the digital filter and converted into chroma (C) data.

The Serial V/A signal is input to DIF-16 board and separated into video data and audio data.

The video data is decoded and converted into 10-bit parallel data ("D1 DATA 0 through 9"), then input to VPR-1 board and sent to the TBC IC mentioned above.

If DEC-65 board (optional) is used, the input analog composite video signal is decoded on DEC-65 board and converted into 10-bit parallel data ("DEC DATA 0 through 9"), then input to VPR-1 board and sent to the same TBC IC.

The TBC IC clamps the component video input signal, selects a necessary data from these input data, transfers it to the reference clock, multiplexes the Y data and C data, and converts them into 10-bit parallel data.

It also generates various test signals under the control of the MPU (IC753), receives the "REC DATA", "PB DATA", and "D1/D2 DATA" (encoder outputs) that are fed back as "multiloops", and executes the diagnosis.

The 10-bit parallel data output from the TBC IC is added VITC data in IC312, then sent to DPR-36 board as recording video data ("REC DATA 0 through 9").

In case that a setup is added to the signal in NTSC system, the data is removed the setup and corrected the level by IC310(NTSC only) in the previous stage of IC312.

Next, the playback process is described below.

The decoded video PB data ("PB DATA 0 through 9") sent from DPR-36 board is input to the video process IC (IC504). The TBC-processed Betacam PB data ("B-CAM DATA 0 through 9") is also sent from TBC-23 board.

The "EE data 0 through 9" that is bypassed from the "REC data" is also input. IC504 selects the input data according to the system mode and sends it to encoder IC (IC505).

The encoder IC converts the input data into various 10-bit parallel data (component Y, R-Y, and B-Y data, composite data, VISC Y data, and D1/D2 data) and outputs them together with the control data and clock signals required for after data processing.

The component Y, R-Y, and B-Y data are converted each from digital to analog so as to produce an analog signal, then output via clamp circuits.

The composite data branches into two paths.

One is converted from digital to analog, clamped, output, and divided on CP-218 board to produce "OUTPUT VIDEO 1 and 2" signals.

The another is converted from digital to analog, superimposed a character signal by the switching of IC514, and output as "OUTPUT VIDEO 3" signal.

The VISC Y data is converted from digital to analog, sent through a low-pass filter to TBC-23 board, and used to adjust the video phase of a Betacam PB signal.

The D1/D2 data is sent directly to DIF-16 board.

Lastly, the control system is described below.

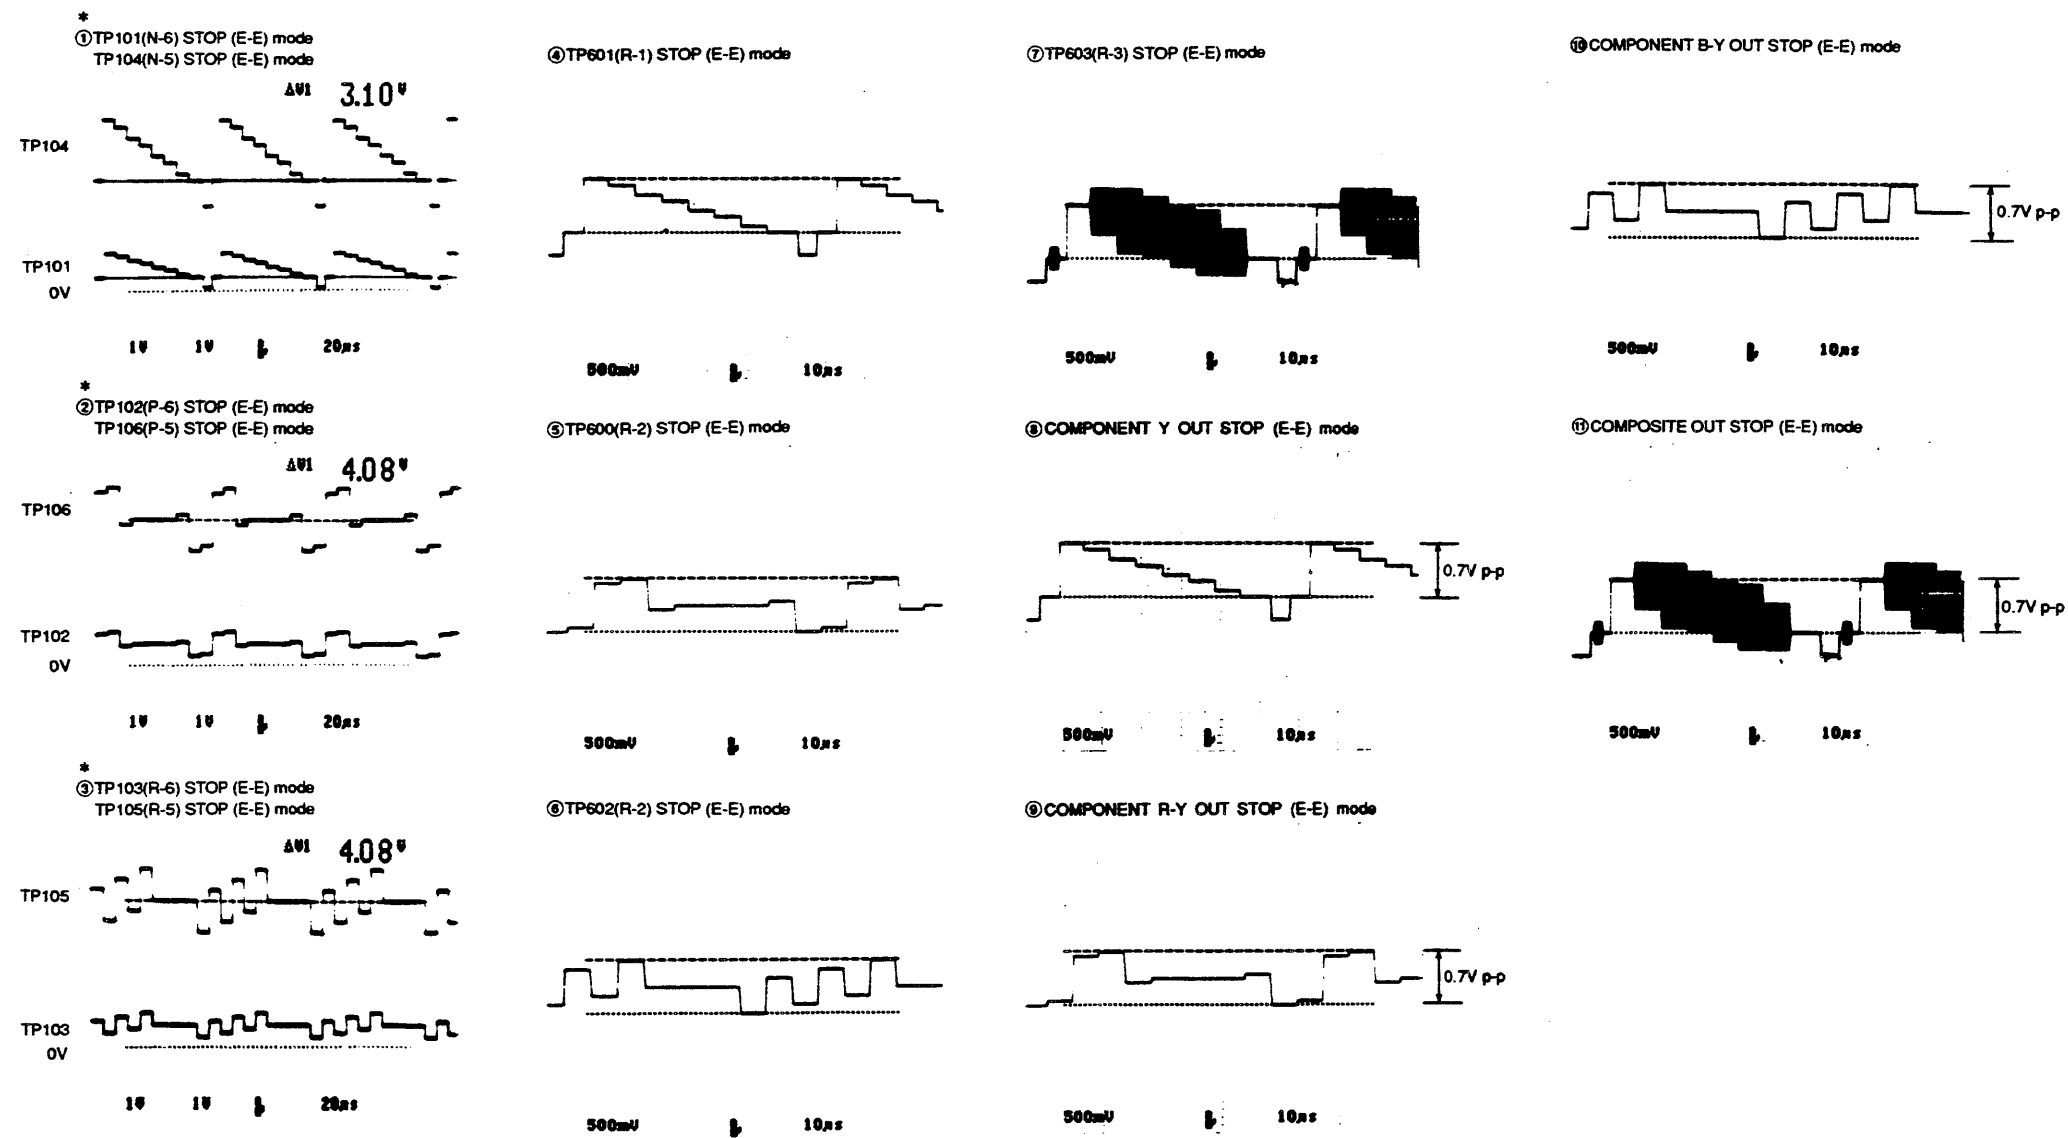

Two systems (video process control circuit and timing reference signal generator circuit) are provided for the control system.

The video process control is performed by the MPU (IC753) under the command ("SYIF2 CMD") of the serial communication from the main CPU on SS-52 board.

The MPU sends control signals to each main IC on VPR-1 board, and controls each signal level and phase in A/D and D/A conversion systems via EVRs (IC754 and IC755).

For the timing reference signal generation, the timing generator IC (IC1019) controls a PLL circuit to generate a 27MHz reference clock signal according to the sync and burst signals separated from an "INPUT REF VIDEO" signal. The generated signal is sent to each board as the video process timing reference signal.

Moreover, audio clock generator IC (IC1032), while receiving this signal, generates various reference audio clock signals synchronized with the reference video signal and sends them to each board as the audio process timing reference signal.

INPUT SIGNAL : 100% COLOR BARS
MODE : STOP (E-E) mode
*...OSCILLOSCOPE : DC mode

[CIRCUIT DESCRIPTION OF APR-1 BOARD]

APR-1 board is an audio processor board that converts the input audio signal into digital data, converts the playback digital data into an analog signal, and controls the digital audio system.

The recording process is described below.

For analog audio inputs, CH1 through CH4 audio signals are input from the “AUDIO INPUT” connectors on the rear panel.

A CUE signal is also input, but it is not passed through APR-1 board.

The analog audio signals input to APR-1 board are adjusted in level for every channel and passed through the emphasis amplifiers.

The signals are then input to A/D converters (IC107 and IC307), converted into serial data (“AD R 1/2 and 3/4”) two by two audio channels, and sent to DPR-36 board.

For digital audio inputs, “AES/EBU digital audio signals” are input.

These signals are serial signals obtained by means that two-channel digital audio data are multiplexed and coded by the bi-phase mark coding method.

CH1/2 and CH3/4 serial signals exist, and 4-channel audio data can be input.

The AES/EBU digital audio signals input to APR-1 board are decoded by AES/EBU receiver/transceiver IC (IC1562) (*AES/EBU receiver ICs (IC7 and IC8)), converted into serial data (“AES R 1/2 and 3/4”) two by two audio channels, and sent to DPR-36 board.

In addition, a Serial V/A signal also exists, but it is input to DIF-16 board and separated into video data and audio data.

Since the audio data is converted into serial data (“SIF R 1/2 and 3/4”) two by two audio channels and sent directly to DPR-36 board, the Serial V/A signal is not passed through APR-1 board.

As described later, however, this conversion process is controlled by the MPU (IC51) on APR-1 board, so the MPU exchanges 8-bit parallel data (“SIF DATA 0 through 7”) with DIF-16 board.

Next, the playback process is described below.

Audio data (“DA T 1/2 and 3/4”, “MONI L/R”, and “AES T 1/2 and 3/4”) are sent from DPR-36 board to APR-1 board in the form of serial data two by two audio channels.

The “DA T 1/2”, “DA T 3/4”, and “MONI L/R” data are input each to the audio digital filter to separate two channels, converted from digital to analog for every channel to produce an analog signal, and output through a de-emphasis amplifier. To “MONI L” and “MONI R” output circuits, the CUE MONITOR signals branched from the CUE output circuits on CUE-1 board are mixed, and the signals output as “MONITOR OUTPUT” are selected by control signals (“DA MUTE” and “CUE MUTE ON”) from the MPU.

The “AES T 1/2” and “AES T 3/4” data input to APR-1 board are encoded by AES/EBU receiver/transceiver IC (IC1562) (*AES/EBU transceiver ICs (IC1 and IC3)),

converted into AES/EBU digital audio signals (“AES O 1/2” and “AES O 3/4”) two by two audio channels, then output.

Additionally, “SIF T 1/2 and 3/4” serial audio data are also output from DPR-36 board. However, these data are sent directly to DIF-16 board and encoded to a Serial V/A signal.

When an analog Betacam tape is played back, the audio signals (“B PB CH-1 and CH-2”) that are played back from the longitudinal tracks of the tape, and the audio signals (“B PB CH-3 and CH-4”) that are AFM-demodulated from the PB RF signal in track C, are sent from AP-28 board to APR-1 board, input through the emphasis amplifiers in the recording system circuit to the A/D converters, and converted into serial data two by two audio channels.

The resultant data are sent to DPR-36 board via the same route as in “AD R 1/2 and 3/4” data.

However, the unit is in the analog PB mode at that time.

Therefore, the data input to DPR-36 board are immediately bypassed to the PB circuit and gain-controlled interlocking with the audio PB level adjustment volume control on the control panel.

The data are then returned to APR-1 board via the same route as in “DA T 1/2 and 3/4” data, passed through the PB processing circuit on APR-1 board, and output as the PB audio signals of the Betacam tape.

Lastly, the control system is described below.

The digital audio system is controlled by the MPU (IC51) under the command (“SYIF3 CMD”) of the serial communication from the main CPU on SS-52 board.

In addition to the control of its own board circuit, this control system controls CUE-1 board via an I/O port (IC54), the audio level meter (fluorescent indicator tube) by serial communication, and the audio data processor IC on DPR-36 board by serial communication.

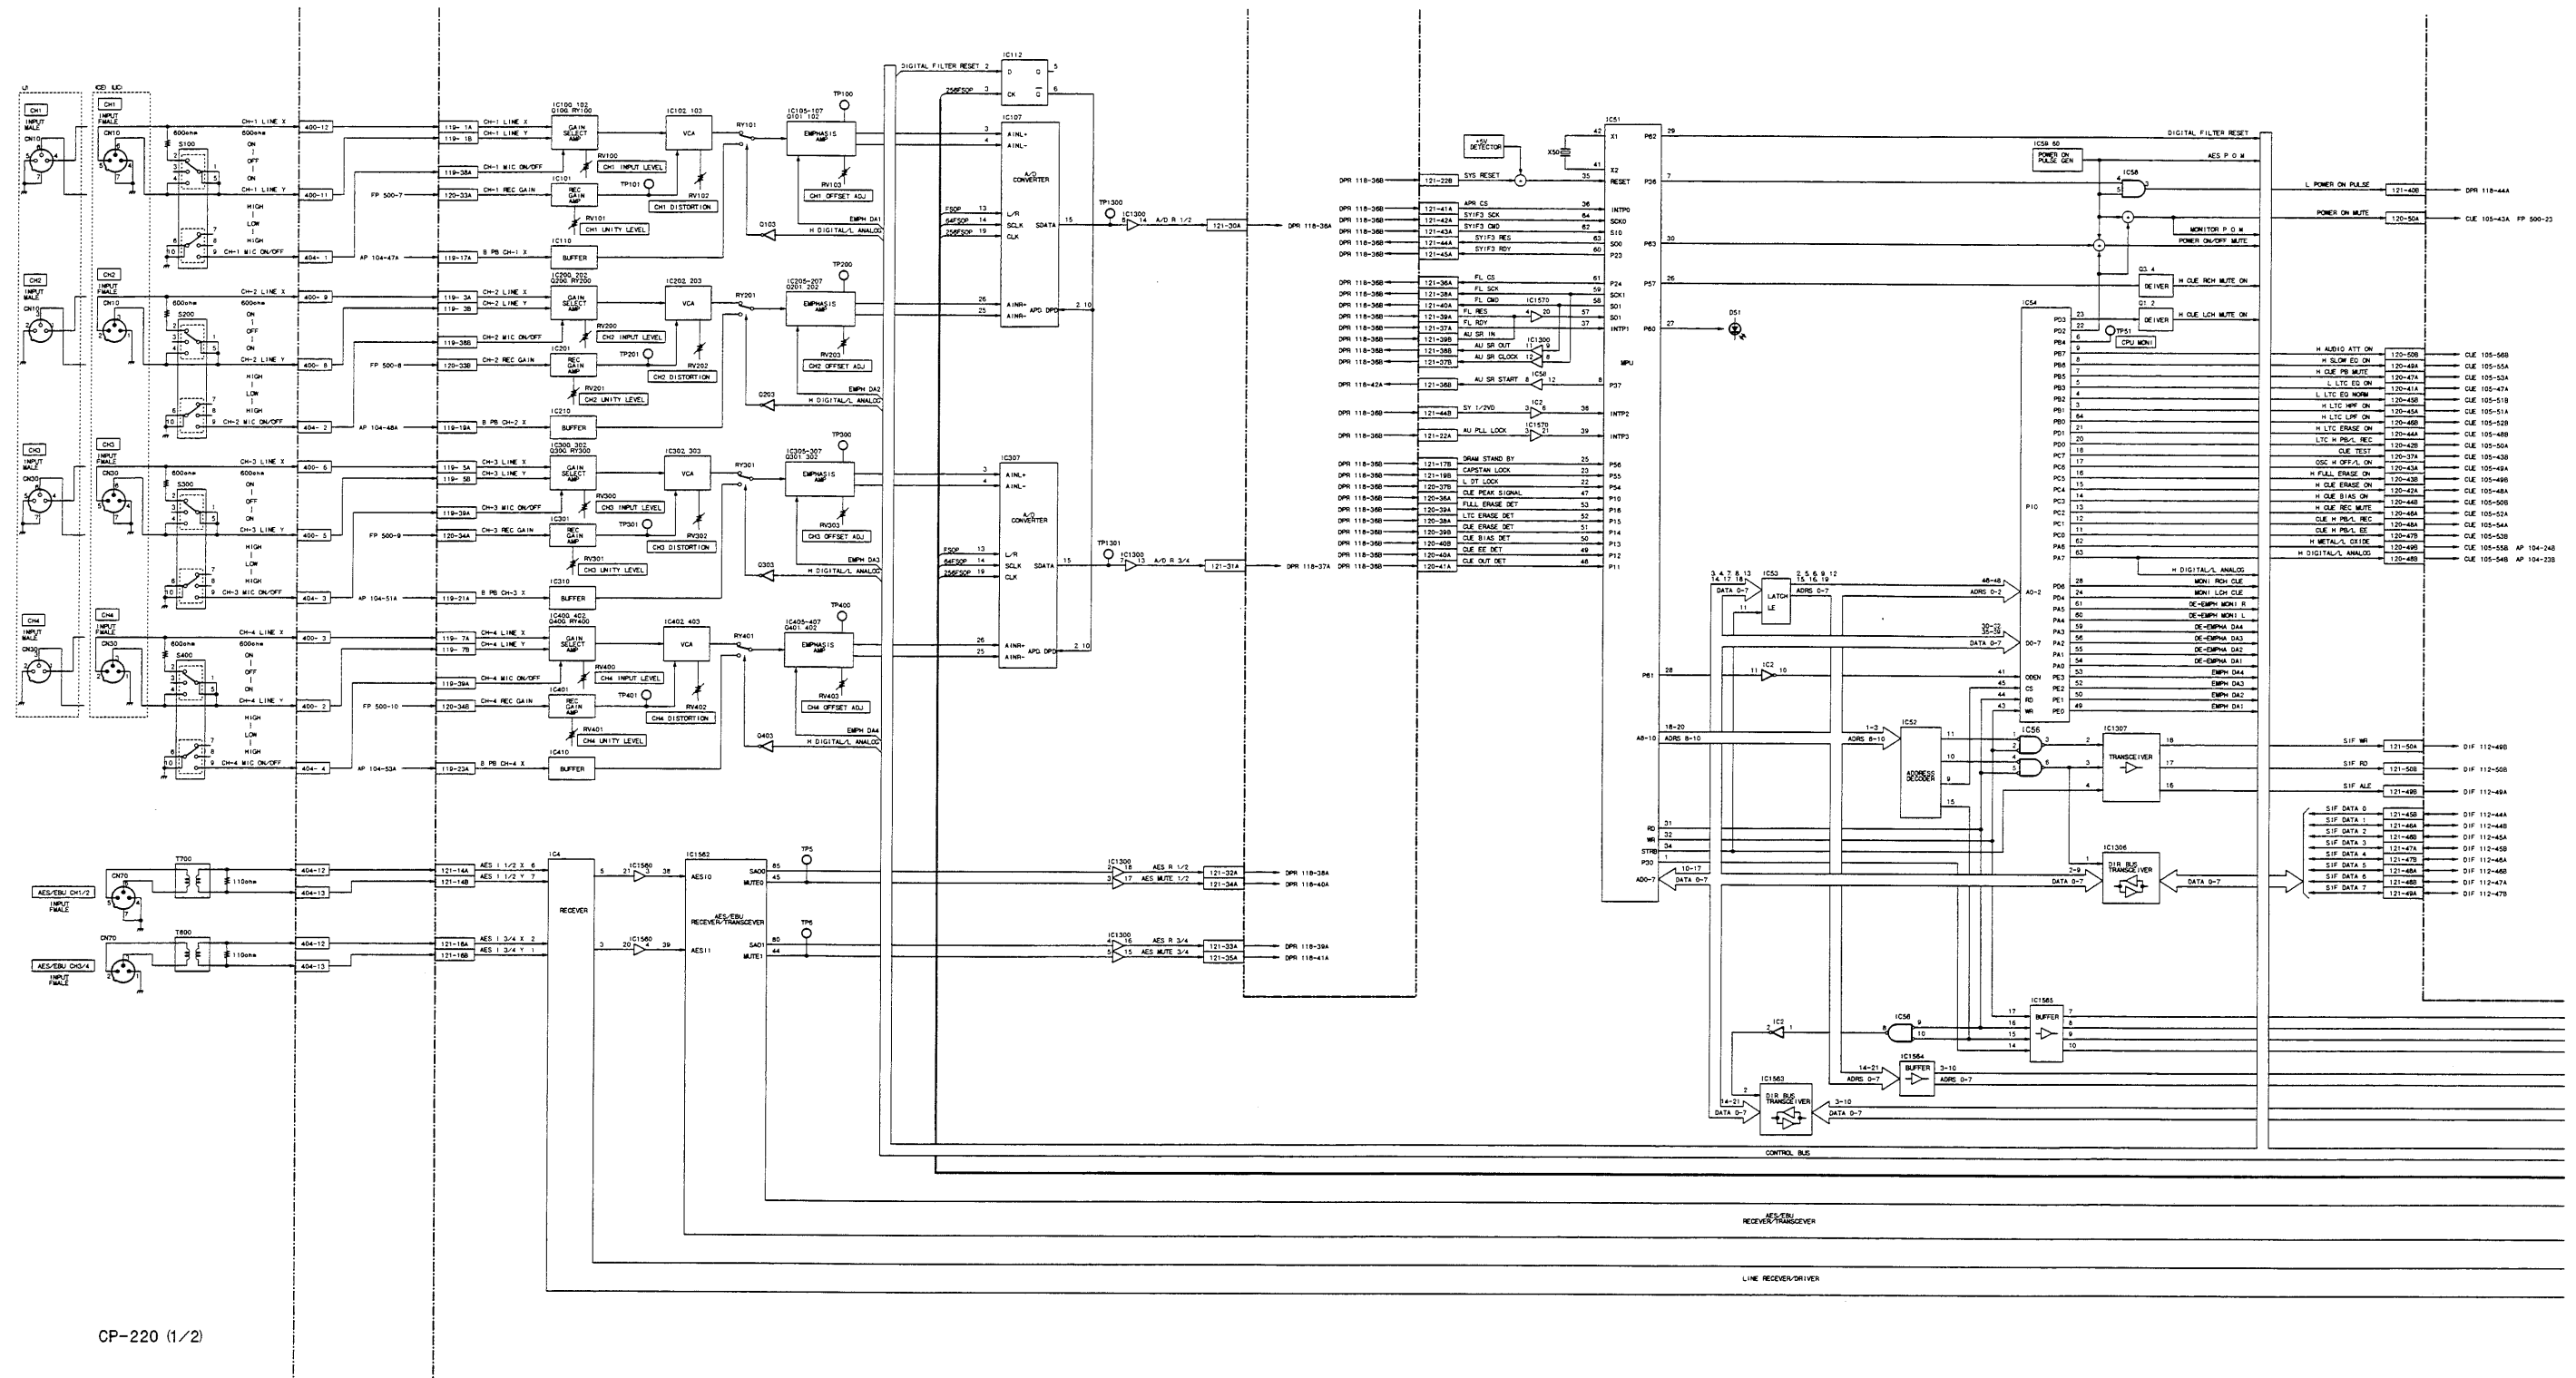

The control system also controls the SIF audio IC on DIF-16 board while exchanging 8-bit parallel data.

Moreover, it operates as the center of the diagnosis and automatic adjustment functions of the whole audio system.

3-13 (a)

[CIRCUIT DESCRIPTION OF DIF-16 BOARD]

DIF-16 board is a D-1 serial digital interface board that converts the input Serial V/A signal into video and audio digital data and also converts the playback video and audio digital data into a Serial V/A signal.

The recording process is described below.
The Serial V/A signal is a digital signal obtained by means that each data of a digital component video signal and four channel digital audio signals are serialized and channel-coded by the S-NRZI (Scrambled Non-return to Zero Inversion) system.
The receiving Serial V/A signal input to DIF-16 board is channel-decoded and converted into 10-bit parallel data in IC408. Before this processing is performed, a Serial V/A signal that passes an equalizer and switch and is re-clocked by a PLL clock in IC408, is output through a cable driver as an active through signal. For a diagnosis, the Serial V/A output signal that has been passed through the transmitting circuit on DIF-16 board is input by a switch in IC408.
The converted 10-bit parallel data branches into two paths. One is input to a D1 decoder (IC413), and only the video data is decoded, converted into 10-bit parallel video data ("D1 DATA 0 through 9"), and sent to VPR-1 board. The another is input to SIF audio receiver IC (IC433), and only the audio data is decoded, converted into serial audio data("SIF R 1/2 and 3/4") two by two audio channels, and sent to DPR-36 board.
Since this conversion process is controlled by the MPU on APR-1 board, the SIF audio receiver IC and the MPU on APR-1 board exchange 8-bit parallel data ("SIF DATA 0 through 7"). For a diagnosis, the serial audio input data sent from DPR-36 board is output by a switch (IC442) in the serial audio data output circuit.

Next, the playback process is described below.
10-bit parallel D1 video data ("D1/D2 DATA 0 through 9") are sent from VPR-1 board, and serial audio data ("SIF T 1/2 and 3/4") two by two audio channels are sent from DPR-36 board to DIF-16 board.
The video data is sent to D1 encoder (IC123).
The audio data is sent to SIF audio transmitter (IC119), converted into 10-bit parallel audio data whose four channels are multiplexed, and sent to the same D1 encoder as in the video data.
In the D1 encoder, the video data and audio data are multiplexed, converted into 10-bit parallel V/A data, then sent.
The sent 10-bit parallel V/A data branches into two paths. One is input to IC124, converted into serial data, and channel-encoded by the S-NRZI system so as to produce the Serial V/A signal.
The resultant signal is output through a cable driver to the "SERIAL V/A OUTPUT 1, 2, and 3" connectors.
The another is input to D1 superimpose IC (IC700) and superimposed a serial character signal sent from SS-52 board.
The resultant signal is input to IC701, converted into serial data, channel-encoded by the S-NRZI system so as to produce the "superimposed Serial V/A signal", then output through a cable driver to the "SERIAL V/A OUTPUT 4" connector.

[CIRCUIT DESCRIPTION OF DPR-36 BOARD]

DPR-36 board is a digital processor board that encodes the recording digital data and decodes the playback digital data.

The recording process is described below.

The recording video data ("REC data 0 through 9") sent from VPR-1 board is input to encoder IC (IC6), where the video data is field-shuffled via memory (IC9 through IC20), then compressed to the data rate of approximately 1/2 by a newly developed bit rate reduction process.

After that, outer error correction code (ECC) is added to the video data, and the data is track-interleaved via memory (IC21 through IC24).

The recording audio data ("ENC 1/2 and 3/4") sent from the audio data processor IC (IC69) described later are also input to the encoder IC via IC905.

Outer ECCs are added to the audio data, and the data are field-shuffled via a part of the memory (IC21 through IC24) mentioned above.

In this process, the video data and audio data are multiplexed.

The multiplexed data is added ID data, inner ECC encoded, then added sync data.

The two groups of REC data ("REC AC D0 through D3" and "REC BD D0 through D3") generated as described above are sent to EQ-45 board for RF processing together with REC ENABLE signals for each head.

All the encoding processes mentioned above are performed by IC6 and IC905.

All the encoding processes are completed in one field.

This thus causes no trouble during editing.

Next, the playback process is described below.

The two groups of AC/BD ADVANCE PB data and CONFIDENCE PB data sent from EQ-45 board are input in parallel to two inner ECC decoder ICs (IC29 and IC38).

The REC data bypassed from the output of the encoder IC for diagnosis execution is also input.

Each inner ECC decoder IC selects a necessary data from these input data, detects the sync data, performs the inner correction based on the detected sync data, then extracts the ID information.

Based on the extracted ID information, each inner ECC decoder performs the clock rate transfer and de-interleaving for the data via memory (IC30, 31, 33, and 34, and IC39, 40, 42, and 43).

In this process, the two groups of data are multiplexed, then separated into V data and V/A data.

They are sent to outer ECC decoder ICs (IC35 and IC44) with each error flag data added.

In IC35, the video data is outer-corrected, de-shuffled via memory (IC36 and IC37), then sent to video decoder IC (IC45).

The audio data is outer-corrected, de-shuffled via internal memory, then error-concealed.

The resultant data is transferred the clock rate, then sent to the audio data processing system.

As described above, an ECC decoder consists of an inner ECC decoder and an outer ECC decoder.

Two pairs of ECC decoders are installed in this unit, and one pair decodes only the audio data.

Such constitution is arranged to obtain both the audio data before erasure and the inserted audio data during editing and insertion.

This enables the confidence playback for cross-fading during audio editing.

The video data input to the video decoder IC is decoded by the bit rate reduction process so as to return to the former data rate, and de-shuffled via memory (IC51 through IC62). The data is then error-concealed via FIFO memory (IC63 through IC67) and sent to VPR-1 board as video PB data ("PB DATA 0 through 9").

Lastly, the audio data processing system is described below. IC69 and IC911 are the audio data processor.

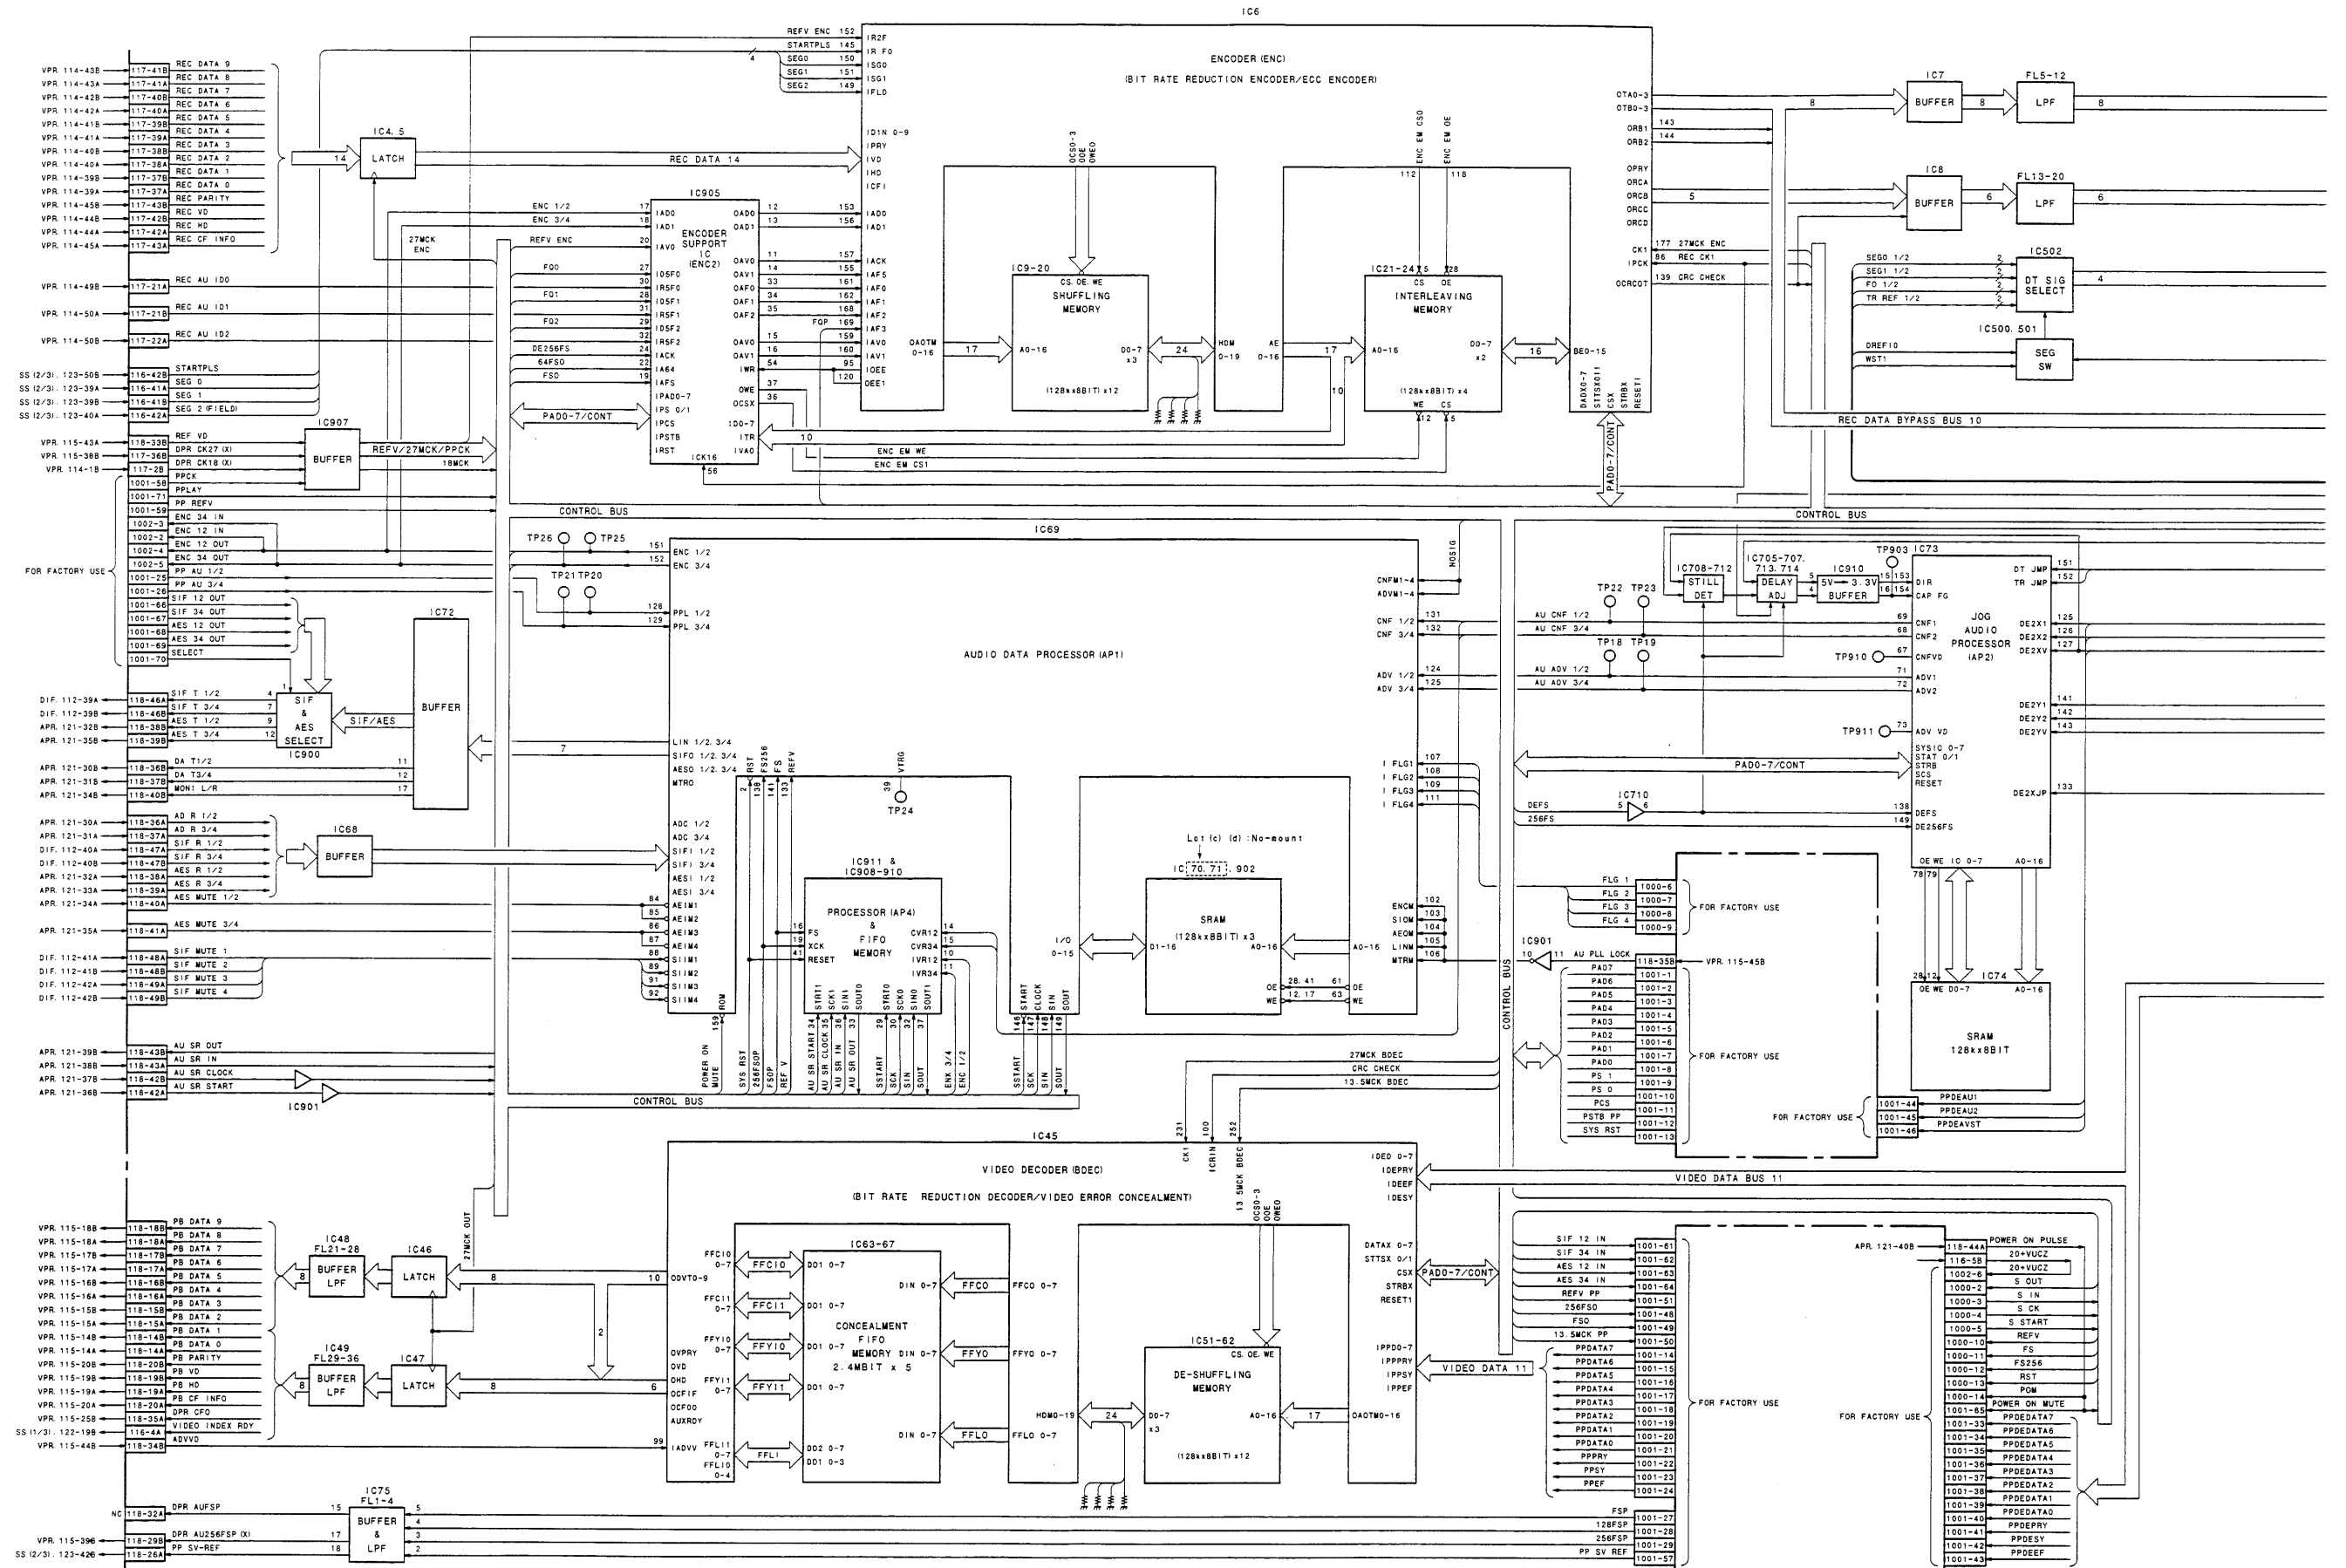

For the recording audio data, "AD R 1/2 and 3/4", and "AES R 1/2 and 3/4" data are sent from APR-1 board, and "SIF R 1/2 and 3/4" data are sent from DIF-16 board, all in the form of serial audio data two by two audio channels.

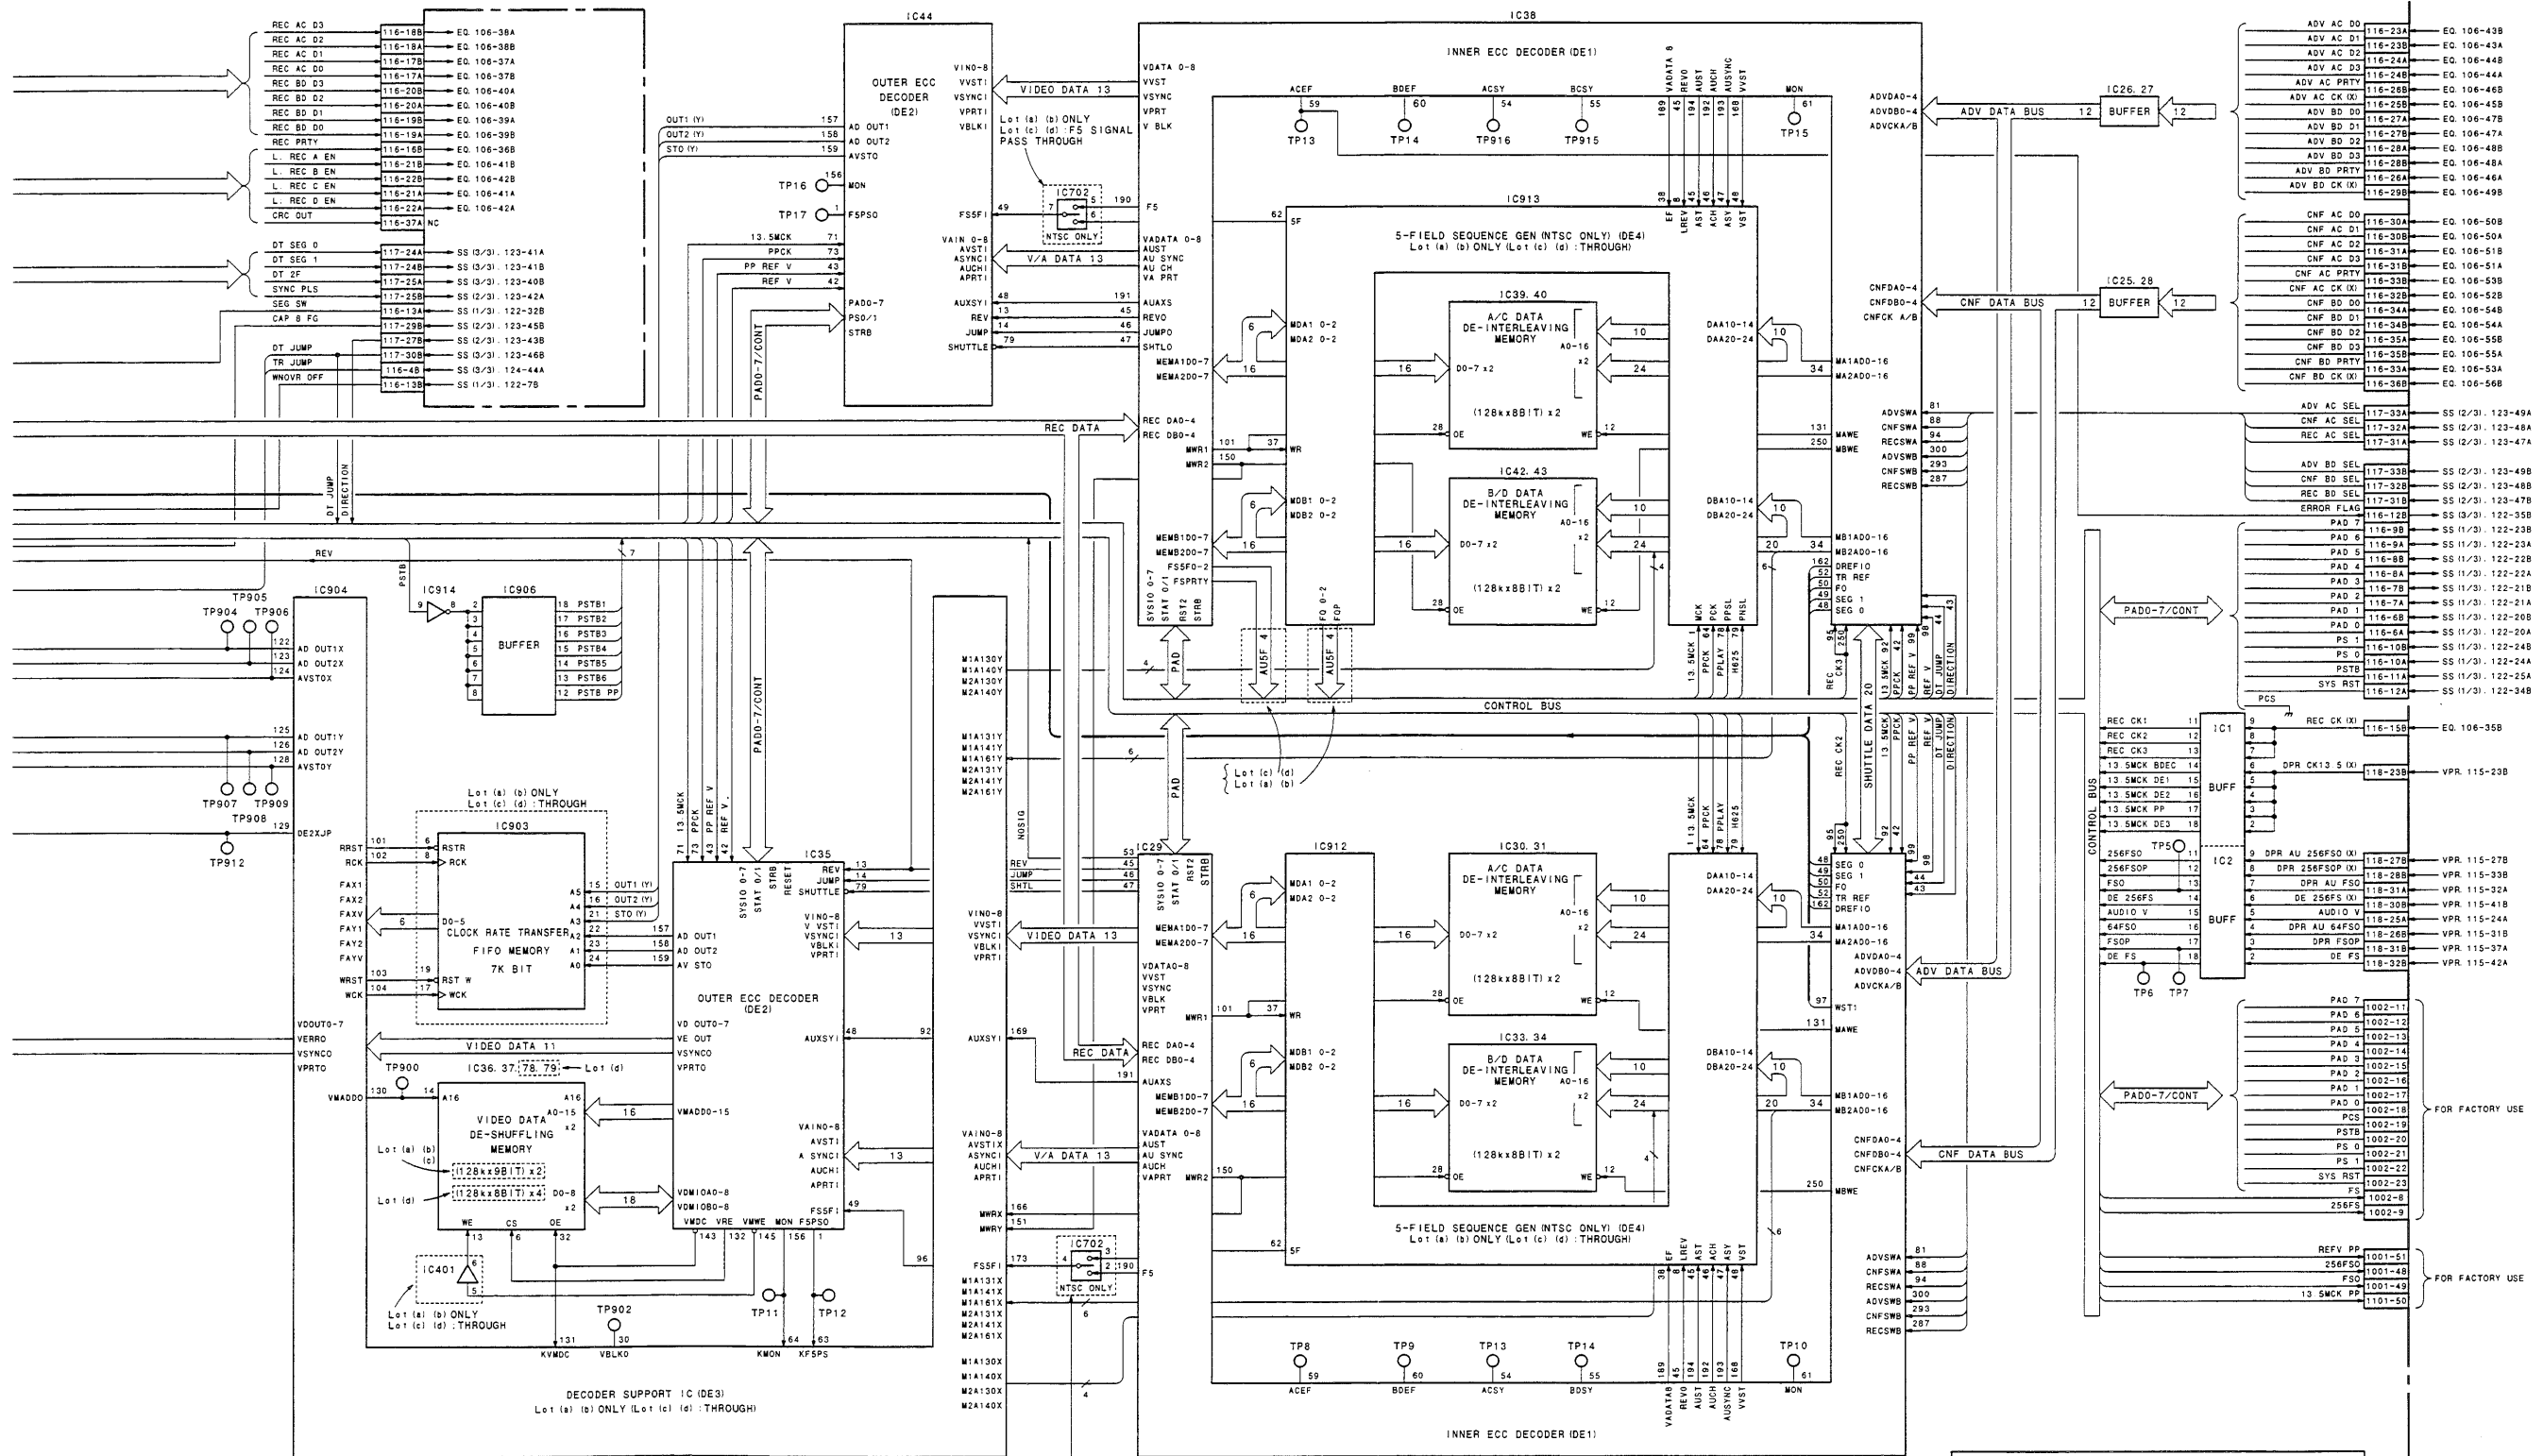

The audio data processor performs the audio data selection, gain control, REC verification, and other data processing, then converts the resultant data into the recording audio data ("ENC 1/2 and 3/4") and sends them to the encoder IC.

In the PB mode, the decoded audio data is sent to IC73. IC73 is a jog audio processor.

It compensates the noise during jog or shuttle using external memory (IC74), and sends data to the audio data processor. The audio data processor performs the gain control, phase adjustment, muting, and other data processing.

It then converts the resultant data into serial audio data "DAT 1/2 and 3/4", "MONI L/R" and "AES T 1/2 and 3/4", and sends them to APR-1 board. In addition, it converts the data into serial audio data "SIF T 1/2 and 3/4", and sends it to DIF-16 board.

[CIRCUIT DESCRIPTION OF EQ-45 BOARD] (Lot No. 002 or higher)

EQ-45 board is an RF processor board that converts the REC data sent from DPR-36 board into a REC RF signal and sends it to the drum and that converts the PB RF signal sent from the drum into PB data and sends it to DPR-36 board.

The recording process is described below.
The two groups of parallel REC data ("REC AC D0 through D3", and "REC BD D0 through D3") that are sent from DPR-36 board to EQ-45 board are converted each into serial data in the interface IC (IC103) and sent through a REC driver (IC204) to the head drum.
The REC driver controls the REC currents of each head according to the command from SS-52 board.
In addition to the REC data, the REC ENABLE signals for each head are also sent from DPR-36 board to EQ-45 board. The select signals for each head (including flying erase heads) are also sent from SS-52 board.
These signals are multiplexed in the interface IC, and the encoded "MPX" signal is sent to the head drum.
The MPX signal is decoded in the head drum and used for switching each REC, PB, and ERASE head amplifier.
"SYSTEM EE1" and "SYSTEM EE2" mode signals are sent from SS-52 board to EQ-45 board.
These are the mode for diagnosis execution.
For the "SYSTEM EE1" mode, the REC data sent from DPR-36 board is bypassed in the interface IC and sent back to DPR-36 board as PB data.
For the "SYSTEM EE2" mode, the REC RF signal (serial REC data) converted by the interface IC is bypassed by switching Q100 through Q103 and input to PB equalizer IC. This enables the circuit on EQ-45 board to be tested.

Next, the playback process is described below.
The PB RF signal that is played back by each PB head and passed through each head amplifier is sent from the head drum to EQ-45 board.
The signals of heads A and C, and heads B and D, that are switched every time the drum rotates by one half, can be transmitted using the same signal line, respectively.
Therefore, the lines required for the PB RF signal transmission are four pairs of "ADV AC", "ADV BD", "CNF AC", and "CNF BD".
In the Betacam tape PB mode, each head amplifier in a digital system is turned off.
Therefore, the PB RF signals of Betacam PB heads Y-A and Y-B use the "ADV AC" line in common.
The PB RF signals of heads C-A and C-B use the "ADV BD" line in common.
The PB RF signals input to EQ-45 board are sent each to PB equalizer IC (IC401, IC501, IC601, or IC701) for VCA, amplitude equalization, and phase equalization.
An envelope is then detected.
In the Betacam tape PB mode, the "PB Y" and "PB C" RF signals that are input through "ADV AC" and "ADV BD" lines to the PB equalizers are output each via only a VCA circuit and sent to DM-89 board (Betacam PB demodulator board).
The RF signal output from each PB equalizer branches into two paths.

One is sent to A/D converter (IC802, IC804, IC902, or IC904).
The another is low-frequency compensated and amplitude limited using a quantizing feedback (QFB) circuit, then sent to the PLL IC.
In consideration of the tape speed information, the PLL IC extracts a PB clock from the input RF signal and sends the clock signal to the A/D converter mentioned above and VITERBI IC (IC805 or IC905).
The A/D converter is required for the VITERBI processing that is executed in the VITERBI IC in the next stage.
The A/D data of the RF signal output from the A/D converter is input to the VITERBI IC, where a regeneration of the bit is executed by a VITERBI system.
The data is then converted into 4-bit parallel data and sent to the interface IC (IC103) together with the clock signal. In the interface IC, parity data is added to the data sent from each VITERBI IC.
Four groups of PB data ("ADV AC D0 through D3", "ADV BD D0 through D3", "CNF AC D0 through D3", and "CNF BD D0 through D3") are then output together with their parity data and clock signals and sent to DPR-36 board.

[CIRCUIT DESCRIPTION OF EQ-45 BOARD] (Lot No. 302 through 001)

EQ-45 board is an RF processor board that converts the REC data sent from DPR-36 board into a REC RF signal and sends it to the drum and that converts the PB RF signal sent from the drum into PB data and sends it to DPR-36 board.

The recording process is described below.
The two groups of parallel REC data ("REC AC D0 through D3", and "REC BD D0 through D3") that are sent from DPR-36 board to EQ-45 board are converted each into serial data in the interface IC (IC103) and sent through a REC driver (IC204) to the head drum.
The REC driver controls the REC currents of each head according to the command from SS-52 board.
In addition to the REC data, the REC ENABLE signals for each head are also sent from DPR-36 board to EQ-45 board.
The select signals for each head (including flying erase heads) are also sent from SS-52 board.
These signals are multiplexed in the interface IC, and the encoded "MPX" signal is sent to the head drum.
The MPX signal is decoded in the head drum and used for switching each REC, PB, and ERASE head amplifier.
"SYSTEM EE1" and "SYSTEM EE2" mode signals are sent from SS-52 board to EQ-45 board.
These are the mode for diagnosis execution.
For the "SYSTEM EE1" mode, the REC data sent from DPR-36 board is bypassed in the interface IC and sent back to DPR-36 board as PB data.
For the "SYSTEM EE2" mode, the REC RF signal (serial REC data) converted by the interface IC is bypassed by switching Q101 through Q104 and input to PB equalizer IC. This enables the circuit on EQ-45 board to be tested.

The RF signal output from each PB equalizer branches into two paths.
One is sent to A/D converter (IC802, IC804, IC902, or IC904).
The another is low-frequency compensated and amplitude limited using a quantizing feedback (QFB) circuit, then sent to the PLL IC.
In consideration of the tape speed information, the PLL IC extracts a PB clock from the input RF signal and sends the clock signal to the A/D converter mentioned above and VITERBI IC (IC805 or IC905).
The A/D converter is required for the VITERBI processing that is executed in the VITERBI IC in the next stage.
The A/D data of the RF signal output from the A/D converter is input to the VITERBI IC, where a regeneration of the bit is executed by a VITERBI system.
The data is then converted into 4-bit parallel data and sent to the interface IC (IC103) together with the clock signal.
In the interface IC, parity data is added to the data sent from each VITERBI IC.
Four groups of PB data ("ADV AC D0 through D3", "ADV BD D0 through D3", "CNF AC D0 through D3", and "CNF BD D0 through D3") are then output together with their parity data and clock signals and sent to DPR-36 board.

Next, the playback process is described below.
The PB RF signal that is played back by each PB head and passed through each head amplifier is sent from the head drum to EQ-45 board.
The signals of heads A and C, and heads B and D, that are switched every time the drum rotates by one half, can be transmitted using the same signal line, respectively.
Therefore, the lines required for the PB RF signal transmission are four pairs of "ADV AC", "ADV BD", "CNF AC", and "CNF BD".

In the Betacam tape PB mode, each head amplifier in a digital system is turned off.
Therefore, the PB RF signals of Betacam PB heads Y-A and Y-B use the "ADV AC" line in common.
The PB RF signals of heads C-A and C-B use the "ADV BD" line in common.
The PB RF signals input to EQ-45 board are sent each to PB equalizer IC (IC401, IC501, IC601, or IC701) for VCA, amplitude equalization, and phase equalization.
An envelope is then detected.
In the Betacam tape PB mode, the "PB Y" and "PB C" RF signals that are input through "ADV AC" and "ADV BD" lines to the PB equalizers are output each via only a VCA circuit and sent to DM-89 board (Betacam PB demodulator board).

[CIRCUIT DESCRIPTION OF CUE-1 BOARD]

CUE-1 board is a CUE/LTC processor board that records and reproduces the CUE and LTC signals recorded on the longitudinal tracks of the tape. CUE-1 board also mounts generator circuits of the AC bias and erase current required for recording these signals.

The CUE signal processing circuit is first described below. The CUE signal is also called a CUE AUDIO signal because an audio signal is usually used as the CUE signal. The CUE signal is input from the "CUE" connector of the "AUDIO INPUT" connector group on the rear panel. The input CUE signal is sent to CUE-1 board, adjusted in level according to the "CUE REC GAIN" instruction (DC voltage) from the control panel, and branches into two paths. One is sent through a noise filter amplifier (IC106) to PB/EE select switch (Q103 and Q104) as an EE signal. The another is passed through a REC equalizer amplifier (IC107), then bias trap as a REC signal, where a bias current is added. By an AC bias method, the signal is then recorded on the tape via the CUE head (AUDIO CH2 head).

The signal heads used on the longitudinal tracks are used in common for REC and PB modes. Both ends of a head's wiring are connected to REC and PB amplifiers via muting circuits, functioning as REC and PB heads when the muting circuit on the opposite side is connected to ground according to the REC and PB modes.

In the case of analog Betacam tape, an AUDIO CH2 signal is recorded on the CUE AUDIO track position, and an AUDIO CH1 track is provided in parallel with the CUE AUDIO track. Therefore, two-channel audio heads are provided, and the AUDIO CH2 head is used in common for digital tape REC/PB operation and Betacam tape PB operation.

For tape reproduction, CUE and AUDIO CH2 signals can be reproduced halfway by a same circuit, and an equal circuit is used in AUDIO CH1 during corresponding section.

That is, the signal reproduced by the head is made flat in frequency response using a head tuning circuit and PB equalizer circuit, and passed through the audio attenuator and slow equalizer controlled by the MPU on APR-1 board. If the PB signals are CH1 and CH2 Betacam PB audio signals, they are sent to AP-28 board from here. If the PB signal is a CUE signal, it is sent to an exclusive PB processing circuit. When the LTC is put into the REC mode while the CUE signal is reproduced (during editing), an LTC crosstalk cancel signal is added to the CUE signal via the PB equalizer amplifier (IC111).

In the exclusive PB processing circuit, the CUE signal is compensated in the undulation of a low-frequency response using a contour effect compensator (IC112 and IC113). The compensated signal is then adjusted in level according to the "CUE PB GAIN" instruction (DC voltage) from the control panel, and sent through a noise filter amplifier (IC108) to PB/EE select switch (Q103 and Q104), where a PB or EE signal is selected according to the command from the MPU on APR-1 board.

The selected signal branches into two paths. One is passed through the output circuit on CUE-1 board as a CUE OUT signal, and output from the "CUE" connector of the "AUDIO OUTPUT" connector group on the rear panel. The another is sent to APR-1 board as a CUE MONITOR signal.

Moreover, a "PEAK DETECT" detector circuit (IC117) is provided. This detector circuit converts the peak level of the CUE signal into a DC voltage and outputs it. The output voltage is sent to the MPU on APR-1 board and used for the CUE level display of an audio level meter.

An LTC signal processing circuit is described next. In case of the recording of an external time code generator signal, the time code signal input from the "TIME CODE IN" connector is sent to CUE-1 board, converted into a TTL level using IC801, and sent to the LTC PROCESSOR IC on SS-52 board as an "LTC SOURCE" signal. The output signal of the LTC PROCESSOR IC is sent back to CUE-1 board as an "REC LTC" signal, passed through an LTC amplifier (IC400), and recorded on the tape by the TC head.

In case of the recording of an internal time code generator signal, the time code signal generated in the LTC PROCESSOR IC on SS-52 board is sent to CUE-1 board as a "REC LTC" signal and recorded on the tape via the same path as described above.

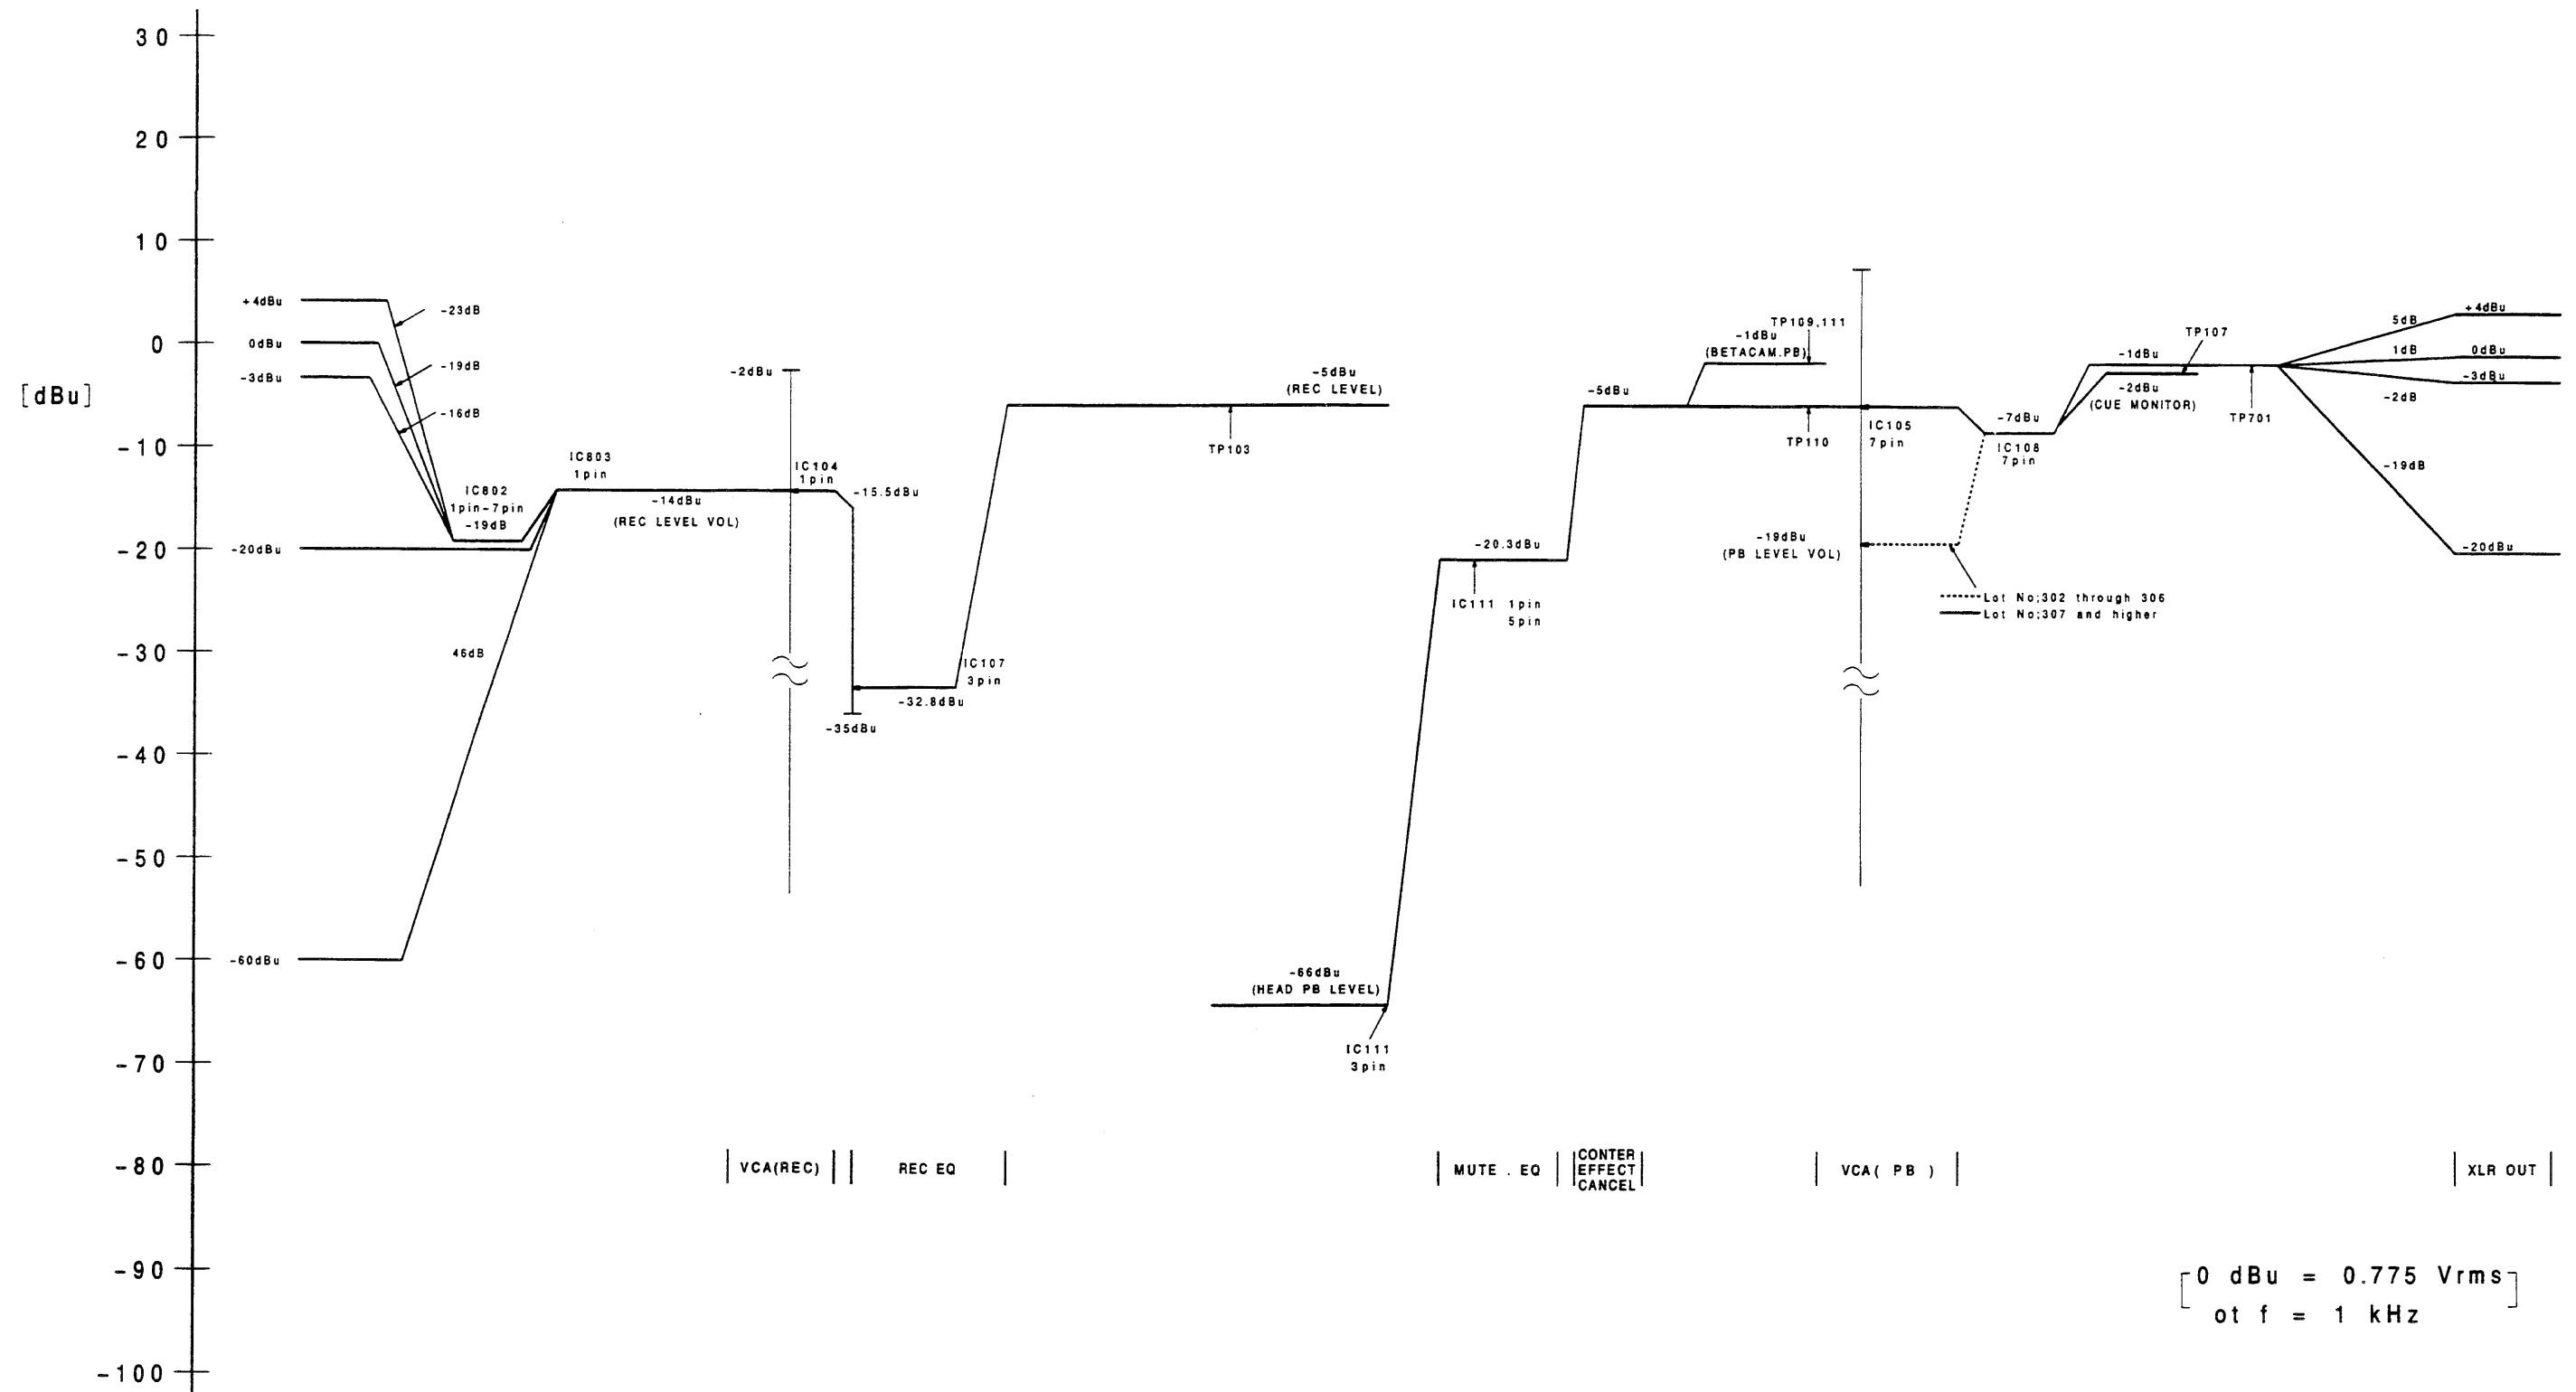

In the LTC PB mode, the signal reproduced by the TC head is passed through a PB equalizer amplifier (IC404), then a low-pass filter and high-pass filter controlled by the MPU on APR-1 board, and shaped in a waveform using IC407. The PB signal is then sent to the LTC PROCESSOR IC on SS-52 board as a "PB LTC" signal. The signal read by the LTC PROCESSOR IC is sent back to CUE-1 board as an "LTC OUT" signal and shaped in a waveform using IC701. The shaped signal is converted into a balanced signal using IC703 and output to the "TIME CODE OUT" connector.

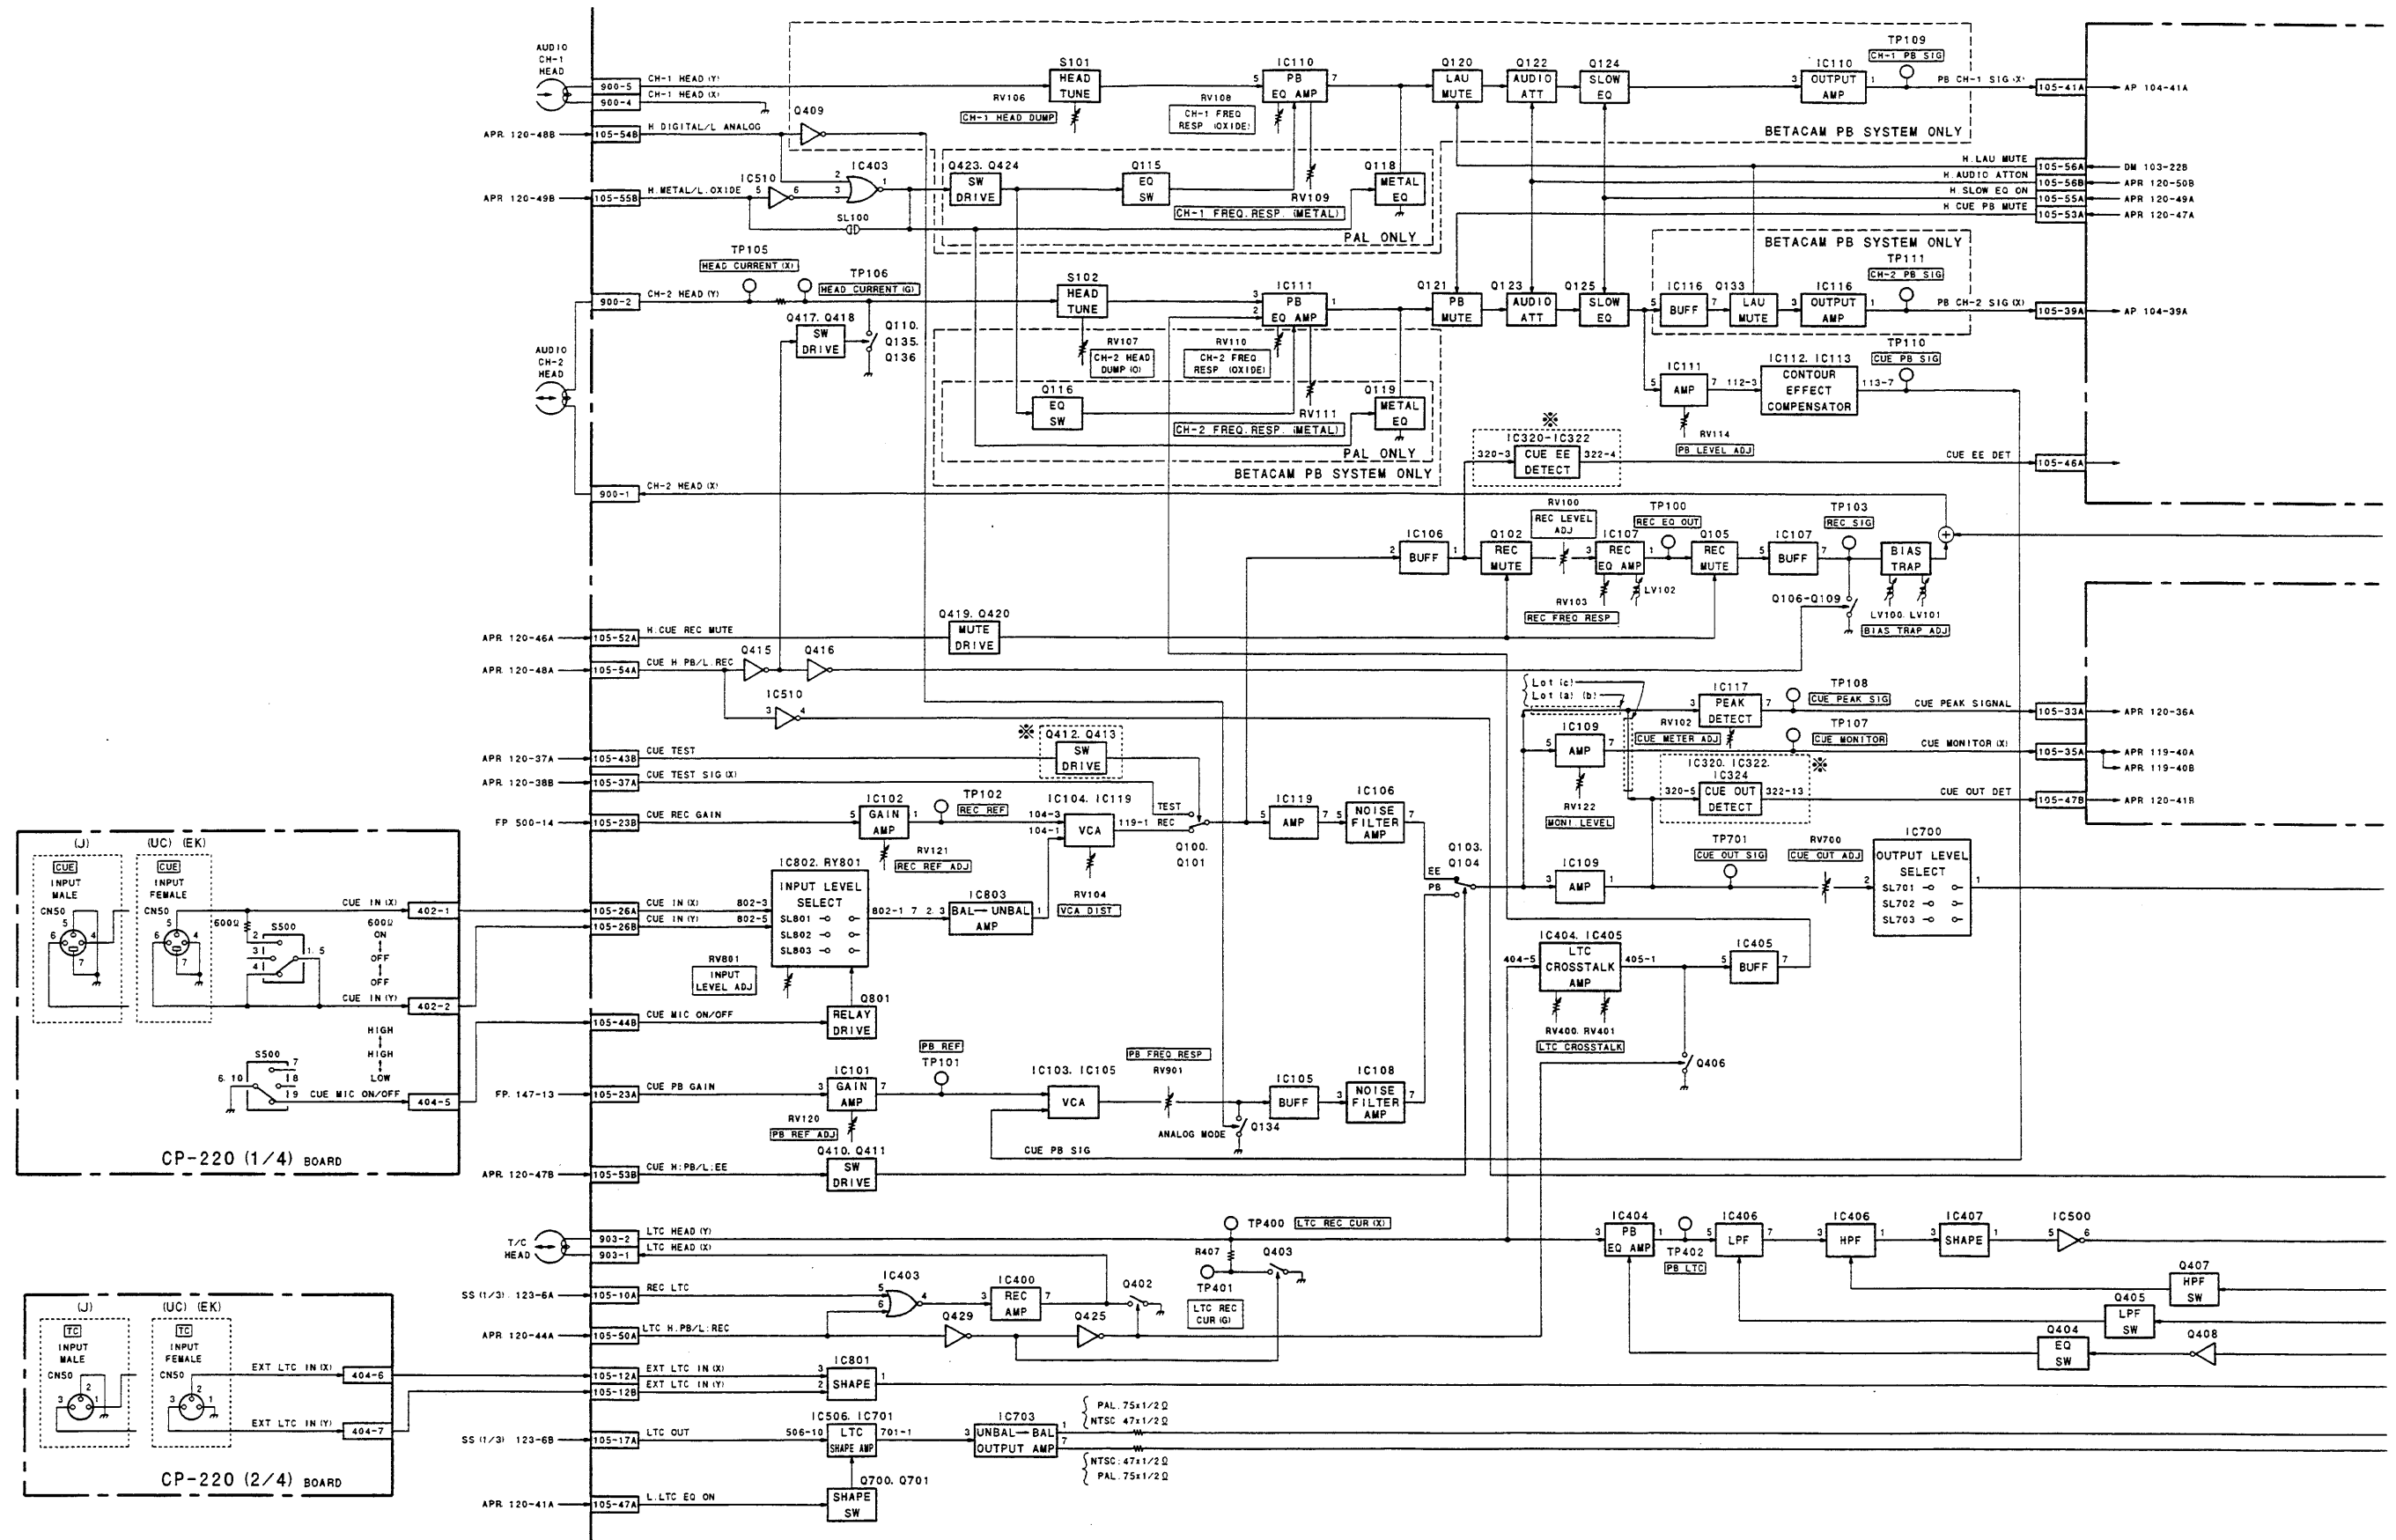

Lastly, an AC bias/erase current generator circuit is described below.

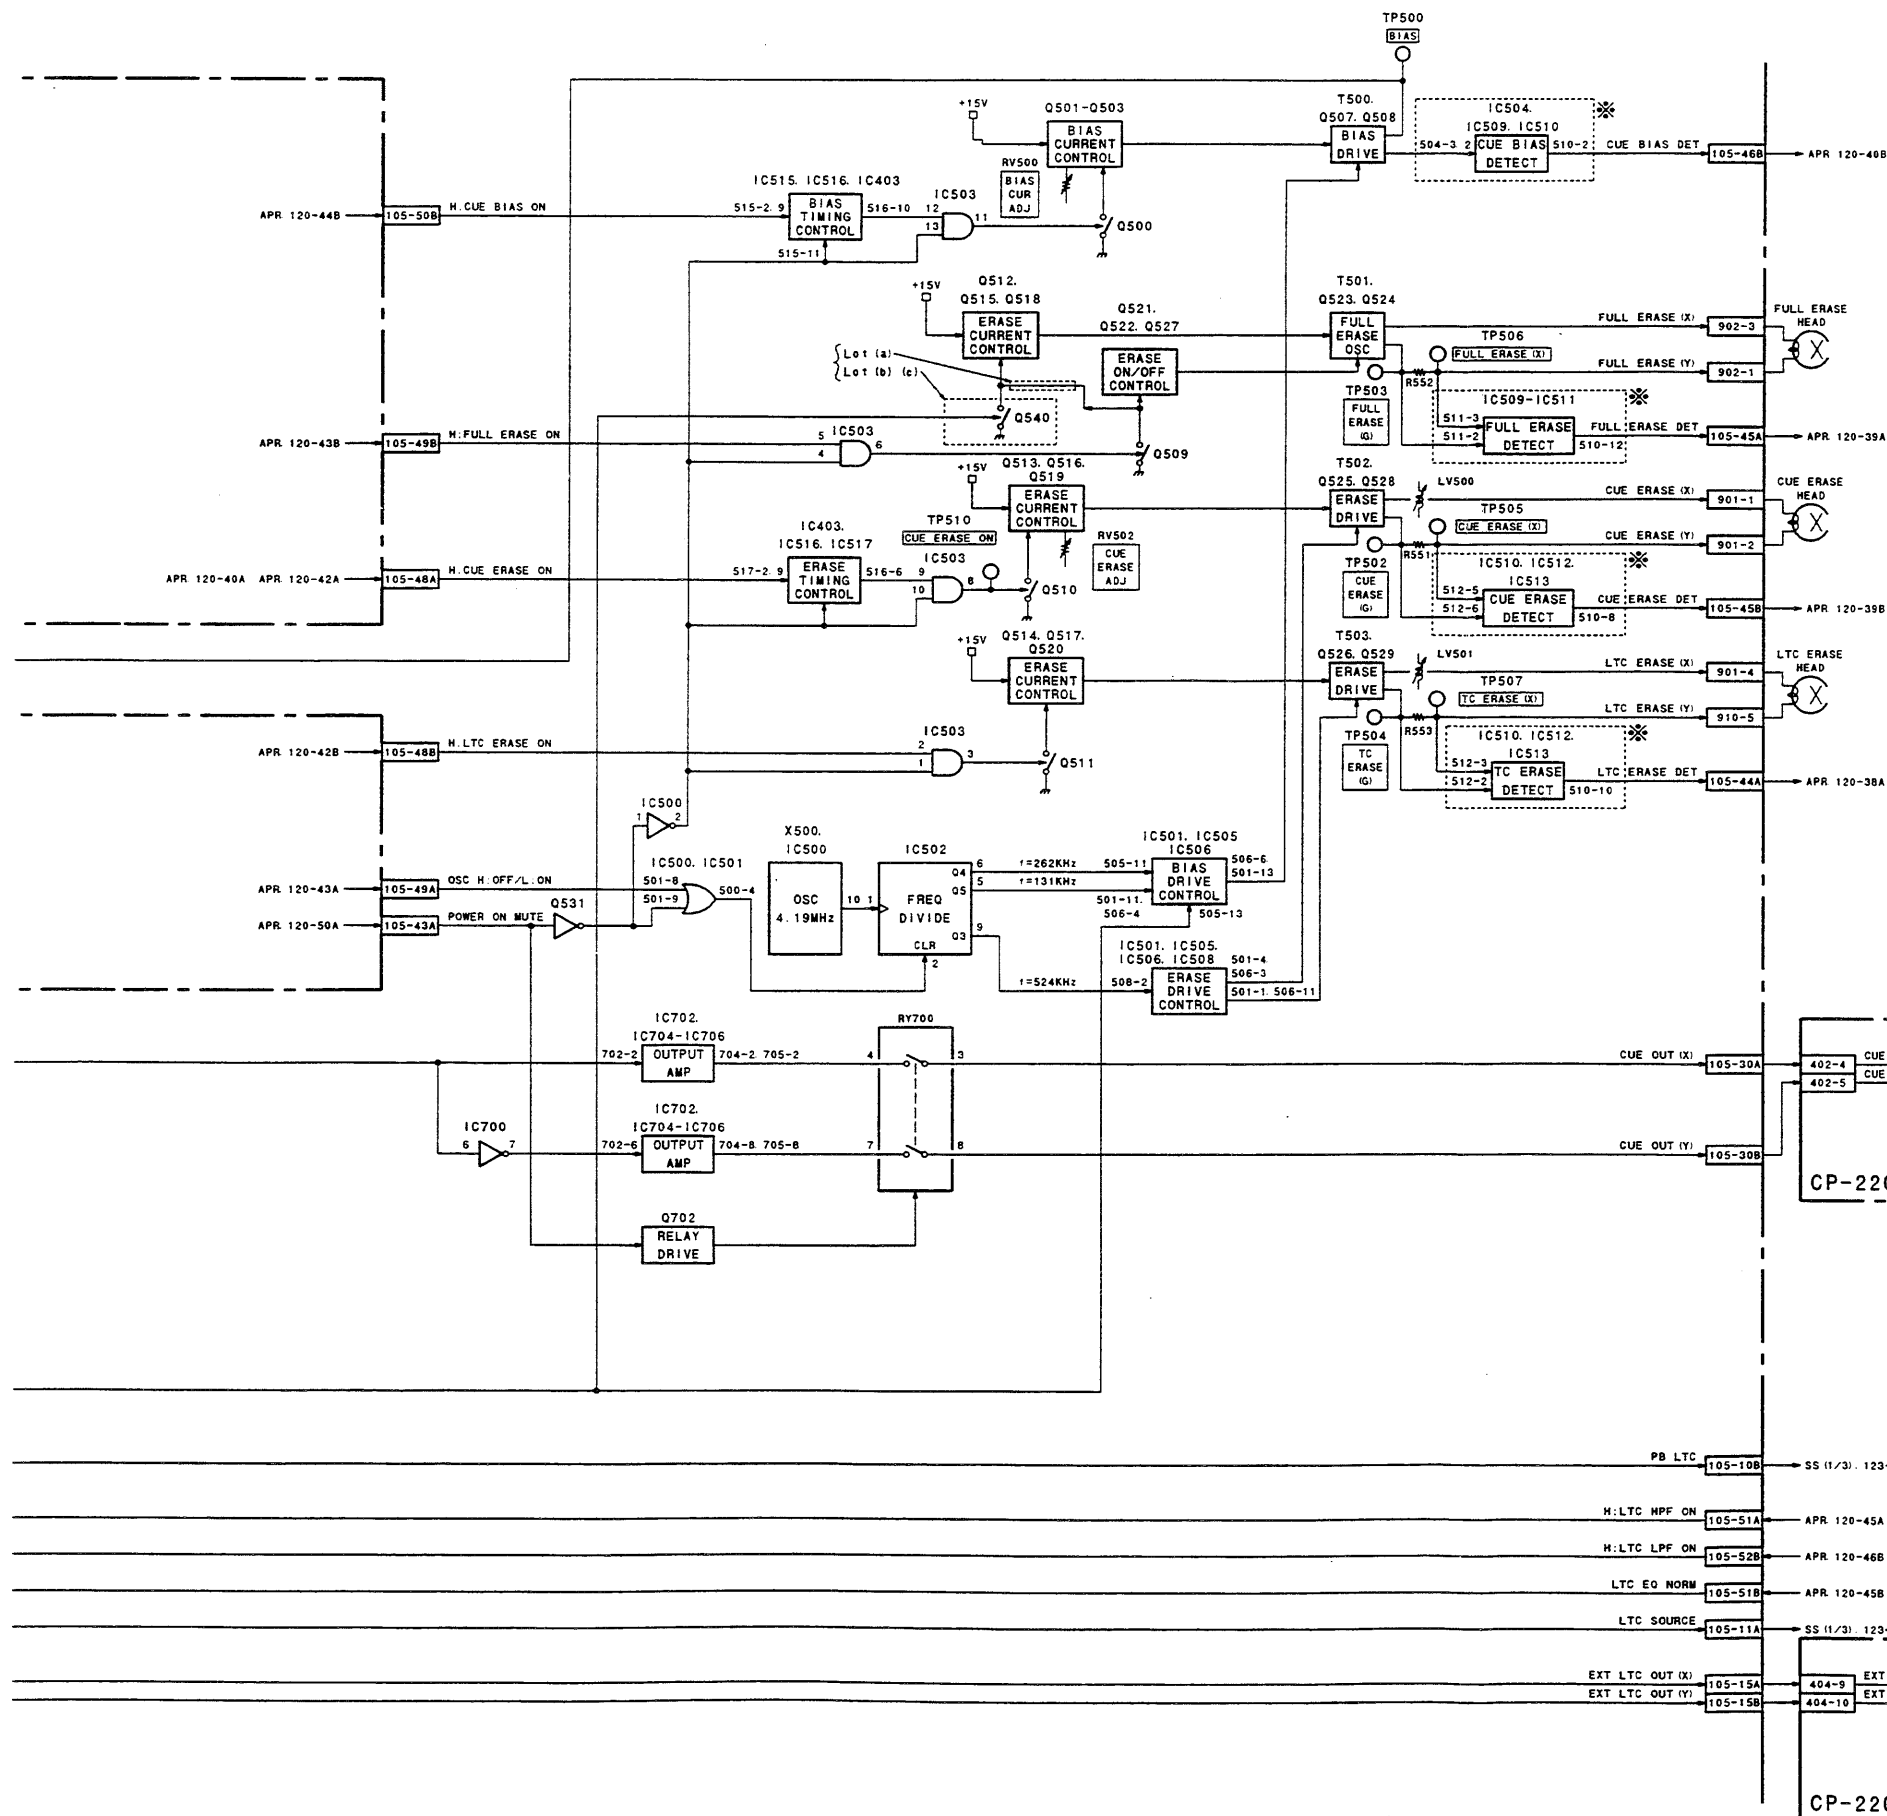

IC500 is a common oscillation source for bias and erase. It always oscillates a 4.19 MHz signal by a crystal oscillator (X500). The oscillation output signal is frequency-divided and turned on and off using IC502. Moreover, a bias drive control signal of 131 kHz is generated from the frequency-divided output signal by a circuit block consisting of IC501, IC505, and IC506, and an erase drive control signal of 44 kHz is generated from the frequency-divided output signal by a circuit block consisting of IC501, IC505, IC506, and IC508. Each drive circuit is controlled by the above-mentioned control signal to generate an AC current. However a full-erase circuit generates an AC current by a self-excited oscillator so as to produce a frequency most suitable for full erase.

The circuits described above are all turned on and off according to commands from the MPU on APR-1 board.

[CIRCUIT DESCRIPTION OF DM-89 BOARD]

DM-89 board is a Betacam PB demodulator board that equalizes the RF signal reproduced from an analog Betacam tape according to the type and speed of the tape, demodulates it to a video signal, and detects a dropout.

The outline of Betacam tape reproduction is first described below.

The Y RF and C RF signals reproduced from the Y and C (chroma) tracks of an analog Betacam tape are sent through the VCA circuit on EQ-45 board to DM-89 board. On DM-89 board, PB Y and PB C signals are equalized, demodulated, and dropout detected by their respective circuit. The resultant signals are sent to TBC-24 board.

When the analog Betacam tape is reproduced by a digital Betacam VTR, the relative speed of the rotary head to the tape increases about 9 % depending on the diameter of the head drum. Therefore, the signal recorded on the helical track is reproduced in the form that its time base is compressed about 9 %. The FM carrier frequency and deviation also significantly vary depending on the metal tape and oxide tape. During shuttle PB, the PB frequency decreases in the FF mode and increases in the REW mode. On DM-89 board, a signal is properly processed under these conditions, and the same performance as the conventional one can be obtained.

The outline of each circuit is described next. PB Y and PB C systems are provided. In the PB Y system, a high-speed search compensator is added so that a luminance signal can be reproduced in the high-speed search mode. Therefore, the PB Y system is described.

A normal PB circuit is explained below. The PB Y RF signal sent to DM-89 board is attenuated to 2/5 and sent to the input circuit block in IC101. For a metal tape, the input RF signal is attenuated to 1/2 and output via a VCA circuit. Select switches are incorporated into the input stage of this circuit block, and reference marker signals corresponding to the PB RF frequency whose time base is compressed on the metal tape can be input for a test.

The PB Y RF signal passed through a VCA circuit is sent to a cosine equalizer circuit. This circuit is an amplitude equalizing circuit that can correct the amplitude characteristic without changing the phase characteristic by combining a delay line and differential amplifier. The signal that has been equalized in amplitude is passed through an RF low-pass filter, equalized in phase using two-stage phase equalizer circuits, and sent to a video switch (IC102). The RF low-pass filter and phase equalizer circuits are provided in parallel for a metal tape and oxide tape and selected using the video switch (IC102).

After that, the signal is equalized into Y main and Y sub frequency characteristics by the cosine equalizer circuit in the next stage. The Y main frequency characteristic is a flat characteristic that attaches importance to the frequency characteristic. The Y sub-frequency characteristic is a characteristic that attaches importance to the counter measures for overmodulation.

For the PB Y RF signal whose basic equalization has been completed, Y MAIN RF and Y SUB RF signals are sent to the demodulator circuit system, and a Y MAIN RF signal is sent to the dropout detector circuit system.

The Y MAIN RF and Y SUB RF signals sent to the demodulator circuit system enter into an overmodulation compensator (OMC)(IC501) and are mixed via a limiter circuit. The mixed Y RF signal is sent to a demodulator

(IC501), where the carrier frequency is multiplied, converted from a frequency into a voltage, then de-emphasized. The resultant signal is sent to the low-pass filter in the next stage to eliminate a frequency-multiplied carrier and demodulated into a video signal. The demodulated Y signal is clamped and nonlinear de-emphasized using IC503, then sent to TBC-24 board as a "Y DEMOD" signal.

The Y MAIN RF signal sent to the dropout detector circuit system is input through a dropout equalizer to dropout detector circuit block IC101, where the signal is compared with the reference voltage. If the signal is less than the reference voltage, a dropout is judged to have occurred. A dropout detection pulse ("Y DO PLS") is then sent to TBC-24 board and other blocks.

The outline of the normal PB circuit is as described above. The normal PB operation indicates the PB range of -1 to +3 times the normal speed in which noiseless PB operation can be performed using a DT function. In this normal PB operation, various corrections for a signal are performed according to the type of a tape. However, the F/V-conversion gain and de-emphasis characteristic of a demodulator vary depending on the tape speed information. The demodulator can be thus used in PB modes other than normal PB.

During shuttle PB, the PB frequency decreases in the FF mode and increases in the REW mode. In the high-speed search mode, especially, in the high-speed FF mode, the FM carrier frequency and deviation decrease. Consequently, the demodulated video signal level decreases, and the waveform is distorted. This makes it difficult to reproduce the video information. Therefore, a high-speed search compensator mentioned below is added in the PB Y system so that a luminance can be reproduced in the high-speed search mode. Each signal is compensated according to the type and speed of a tape.

"SEARCH SW" gate which consists of three blocks of RF switches is provided. The signal whose only amplitude has been equalized passes the gate via a "FLAT" switch in the high-speed REW mode. The signal that has been passed through a "SEARCH LPF" filter passes the gate via a "LOW" switch in the high-speed FF mode. And the signal that has been equalized passes the gate via a "MID" switch in the middle search speed mode. The signal that has passed the gate is emphasized according to the tape speed by a "SEARCH TUNE" circuit and input to the demodulator (IC501) and dropout detector circuit (IC101) instead of a normal PB signal by the selection of RF switches. In the high-speed FF mode, the frequency-multiplied carrier elimination filter in the stage following the demodulator is also changed to "SEARCH LPF".

Lastly, a control system is described below.

Principal controls for each circuit block corresponding to the type and speed of a tape are performed by the MPU (IC906) on DM-89 board under the command ("SYIF2 CMD") of the serial communication from the main CPU on SS-52 board. The main controls are as follows: METAL/OXIDE selection, each selection in the high-speed search compensator, and analog control of VCAs, cosine equalizers, OMCs, and dropout detection reference value via D/A converters (IC904 and IC905). The backup operation by an EEP-ROM (IC908) is also performed.

[CIRCUIT DESCRIPTION OF TBC-24 BOARD]

TBC-24 board is a Betacam PB TBC (A/D conversion) board that generates a clock following the jitter of the demodulation video signal from DM-89 board, converts the demodulation video signal into digital video data using this clock, and sends it to TBC-23 board.

The outline of a process is first described below.

The video signal that is reproduced from a tape and demodulated contains a jitter component. To eliminate the jitter component, a clock that contains the same jitter component is generated using a write clock generator circuit. When a PB video signal is sampled by this write clock, the A/D-converted digital video data becomes data whose jitter component is canceled.

Since Y and C signals are recorded on the different video tracks of a tape, the way in which each jitter is generated also differs. Therefore, two write clock generator circuits and A/D converter circuits for Y and C signal systems are provided on TBC-24 board. These circuits are almost the same respectively in circuit configuration.

The outline of each circuit is described next. Since Y and C signal systems are almost the same in configuration, only the Y signal system is described.

A write clock generator circuit is first explained below. IC301 plays a leading part in a Y write clock generator circuit. IC301 extracts an H sync signal from the input demodulation Y signal and sends it to the sync guard circuit on TBC-23 board. The sync guard circuit eliminates H sync signal with irregular intervals, separates only H sync signal with regular intervals, and sends it back to IC301 as a SELECT H WINDOW (SHW) signal. IC301 doubly differentiates the demodulation Y signal and gates the detected sync edge signal by this SHW signal. After that, IC301 outputs only the sync edge signal, that is judged to be normal, from pin 50 as a SELECT H (SH) signal.

The output SH signal is converted into a sawtooth wave using a sawtooth wave generator in a phase-shift circuit (IC302, IC307, IC308, and IC409). The sawtooth wave inverts a comparator (IC308) by the phase obtained when the "SCH TRACKING" signal from TBC-23 board and the tape speed information are added to the phase set using RV300, and triggers a monostable multivibrator (IC307) to generate a pulse.

The output signal of normal VCO (IC406) (approximately 14.8 MHz during normal PB) is input to pin 67 of IC301 and frequency-divided into the H frequency using a PLL counter that is reset by the output pulse of the phase-shift circuit described above. A COUNT H signal is generated on the basis of this frequency-divided signal. The COUNT H signal is converted into a signal that has a slope for phase comparison in the inversion portion, and output from pins 16 and 17.

The slope of the COUNT H signal output from pin 16 is sampled and held by the output pulse of the phase-shift circuit described above so as to produce a phase error voltage. The phase error voltage is passed through a cutoff switch (IC400) during guard band period and fed back to the normal VCO (IC406) via a normal error amplifier. A PLL loop is formed via this VCO. As a result, the VCO oscillates with

the frequency locked to the input demodulation Y signal and is used for a Y write clock. The slope of the COUNT H signal output from pin 17 is detected its gradient. The result is fed back to pin 14 to maintain the gradient of the slope in the specified value.

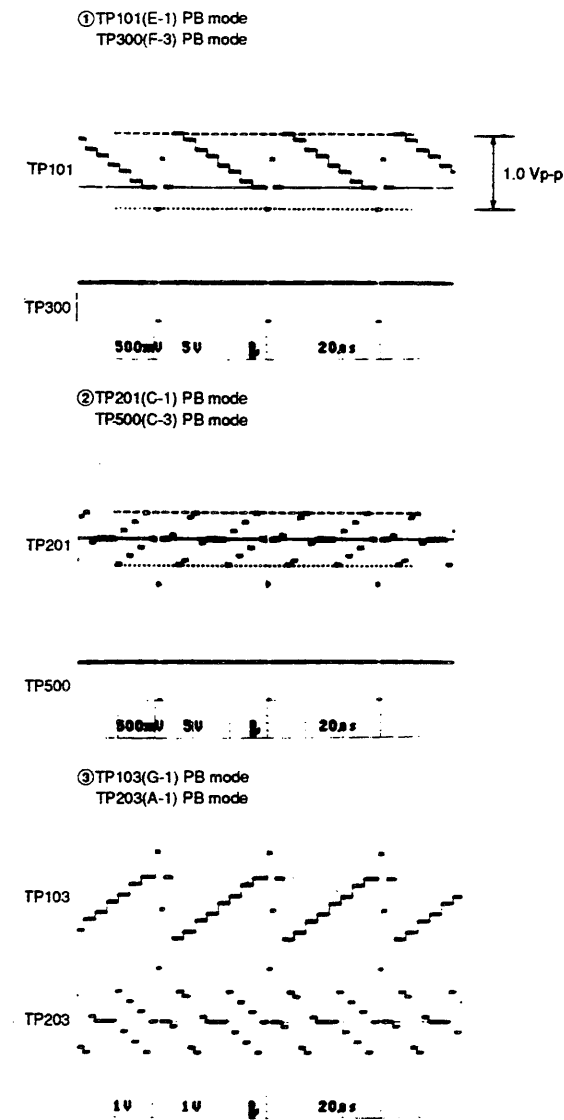

IC301 incorporates an impact error detector circuit to cancel an impact jitter occurring when the rotary head touches the tape. The impact error detector circuit takes in the phase error voltage before integration through the A/D converter (IC404), then generates the signal data corresponding to the coming impact jitter by methods of memory, analysis, and forecast, and outputs it. The "IMPACT ERROR" signal obtained when this data is converted from digital into analog is added to a "NORMAL ERROR" voltage to control the normal VCO.

The above description applies to the normal PB mode. For high-speed search mode, a wide-range VCO is incorporated in IC301. The phase error voltage is fed back as a "BID ERROR" voltage via an error amplifier for a wide range. At that time, a "BID ERROR" signal corresponding to the tape speed information is also added to control the wide-range VCO.

The normal VCO and wide-range VCO are selected using an "F BID" signal from TBC-23 board. The selected VCO output signal is sent to the PLL counter in IC301, and simultaneously, it is output to an A/D converter circuit as a Y write clock ("Y WCK") signal. A "Y GATED WCK" signal that eight clock periods (including the reset period of the VCO) are muted is also sent to TBC-23 board.

Moreover, IC301 generates a "WZ" (WRITE ZERO) signal when it receives the output signal of the PLL counter, and sends it to TBC-23 board. IC304 also generates a "W CLP PLS" (WRITE CLAMP pulse) when it receives the SH signal, and sends it to the A/D converter circuit, and to the demodulator circuit on DM-89 board.

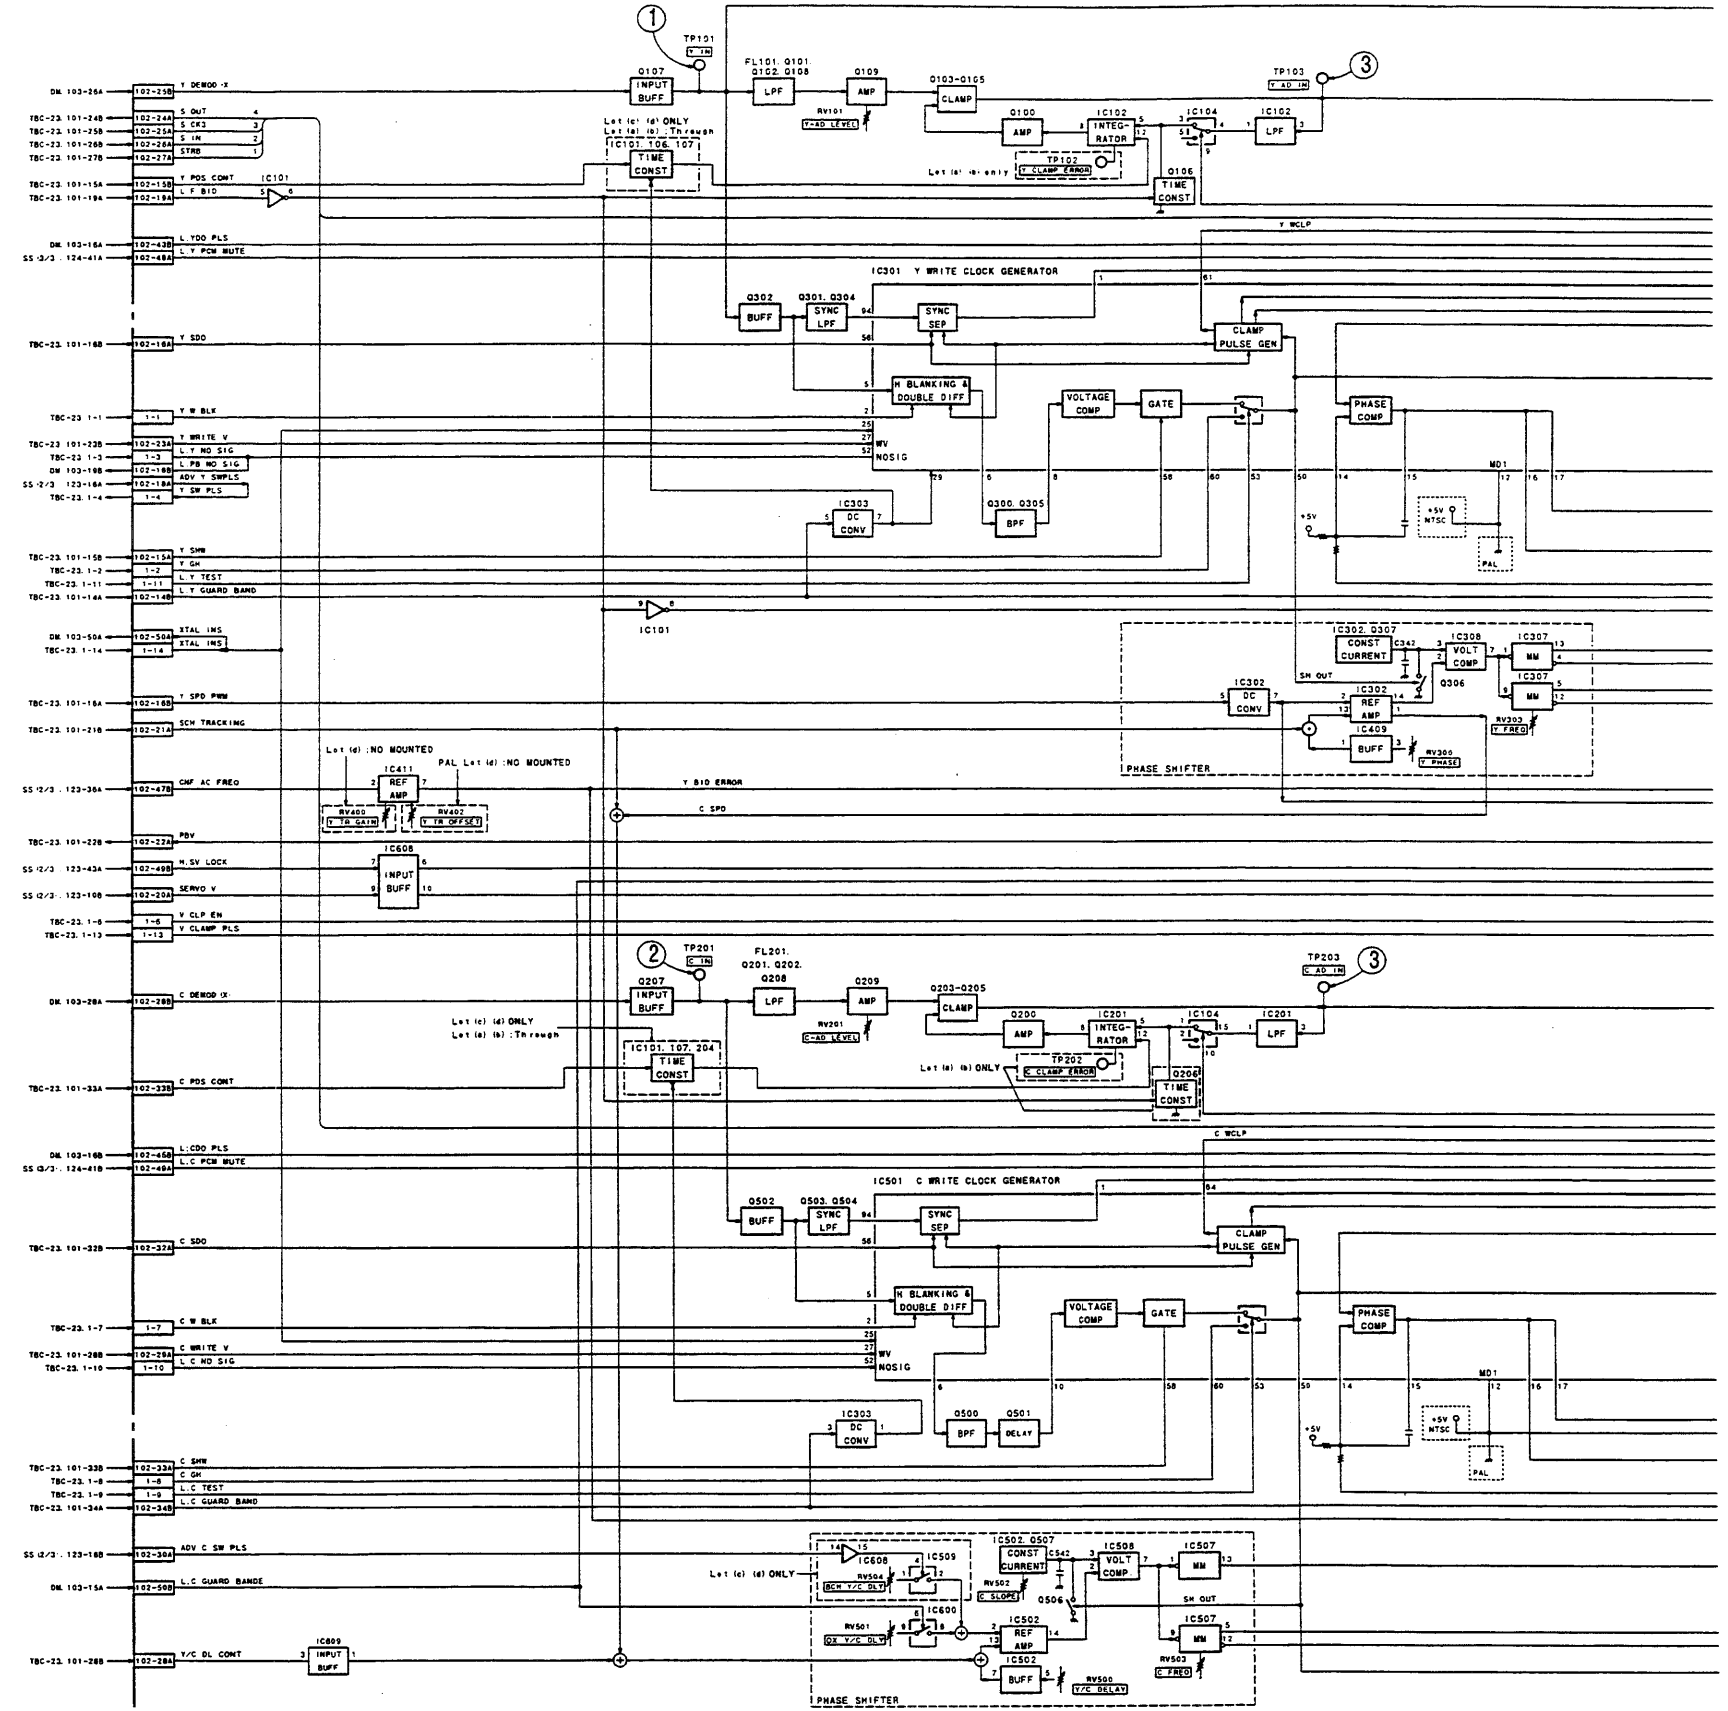

In the A/D converter circuit, the input demodulation Y signal is passed through a low-pass filter, clamped in pedestal level using a clamping circuit, and sent to an A/D converter (IC100). The error voltage for clamping is generated when the sample-and-hold voltage using the "Y W CLP" pulse that is generated by a write clock generator circuit and the hold voltage of the "Y PDS CONT" data that is fed back from TBC-23 board are compared with the reference voltage. The demodulation Y signal input to the A/D converter (IC100) is sampled using a write clock that is generated by the write clock generator circuit, and converted into eight-bit digital video data whose jitter is corrected. This data is passed through a digital delay line (IC103) so that it coincides in timing with the "Y DO PLS" pulse from DM-89 board. The data is then sent to TBC-23 board.

[CIRCUIT DESCRIPTION OF TBC-23 BOARD]

TBC-23 board is a Betacam PB TBC (sequence/reference) board that corrects the time base, dropout, and picture quality and controls the phase by a VISC, with respect to the digital video data from TBC-24 board, and generates various timing signals used in a TBC block.

A sequence processing circuit is first described below.

Since Y and C signal systems are similar in configuration, only the Y signal system is primarily described except the complementary explanation of the block peculiar to the C signal system.

The eight-bit Y data from TBC-24 board is sent to a video data processing circuit in IC104, and the guard band period is replaced by a gray code (01H) and the dropout detection block is replaced by a DO code (00H) as the preparation of dropout compensation. After that, the data is written in field memory (IC107) under the control of a memory control circuit in IC104. Pedestal data is detected in the initial stage of the video data processing circuit, and "PDS CONT" data is fed back to TBC-24 board so that a level of 10H (80H for a chroma signal) is obtained. IC104 also has a sync guard circuit and separates only H sync signal with regular intervals from the H sync signal from the write clock generator circuit on TBC-24 board and sends it back as an SHW (SELECT H WINDOW) signal.

The Y data written in the field memory (IC107) is read by the read clock locked to the reference signal under the control of the memory control circuit in IC104. As a result, the Y data whose time base is corrected is obtained.

The reference V timing signal uses an "SQ V" signal in the normal and DT PB modes and uses an "SV V" signal in the high-speed PB mode.

An analog Betacam chroma signal is recorded on the tape by a system called CTDM (Compressed Time Division Multiplex) in which the R-Y and B-Y signals whose time base is compressed are arranged within an H period. Therefore, when a chroma signal is read from the field memory (IC109), R-Y and B-Y data are alternately read to convert into a signal in which the time-base corrected R-Y and B-Y data are alternately arranged for every clock.

The Y data whose time base has been corrected is input to the three-line dropout compensator (IC110) in the next stage to compensate for a dropout and sent to the next stage as 10-bit data. In the three-line dropout compensator, signals before and after 1H are prepared via delay lines. If a dropout occurs, the signal is replaced by the average data of the signals before and after 1H. If a dropout occurs in the signal after 1H, too, the signal is replaced by the data before 1H.

In the edge noise reducer (ENR) in the next stage, the Y data whose dropout has been compensated is corrected in picture quality by a digital correlation circuit. Chroma data is also corrected in picture quality by a line crawl canceler (LCC)(IC113). The Y data and chroma data are then input to IC206, output as 10-bit digital video data that is multiplexed in the order of "CB, Y, CR, Y, CB, Y, CR, Y, ...", and sent to VPR-1 board as "B-CAM DATA 0 to 9".

In case that a setup is added to the signal in NTSC system, the data is removed the setup and corrected the level by IC228 (NTSC only) in the later stage of IC206, then output.

A reference system is described next. A circuit that generates various timing signals used in the TBC block and a circuit that controls the TBC process are provided in the reference system.

The timing signals used in the TBC block are generated by IC206. IC206 has a "Read Timing Pulse Generator" function as well as a "Y/C Complex" function that multiplexes the Y and C data described above. IC206 generates various timing signals on the basis of the timing reference signals ("REF CK 27", "REF 4FSC", "B-CAM CF", "TBC VD", and "TBC HD") from the timing reference signal generator circuit on VPR-1 board, and sends them to ICs of each sequence process block.

The TBC process is controlled by the MPU (IC202) on TBC-23 board under the command ("SYIF2 CMD") of the serial communication from the main CPU on SS-52 board. The MPU sends the mode information and operation command to each main IC of the TBC process, outputs eight-bit Y/C delay control data, test commands, and other control signals, and saves the adjustment data of the circuit on TBC-23 board in an EEPROM (IC200).

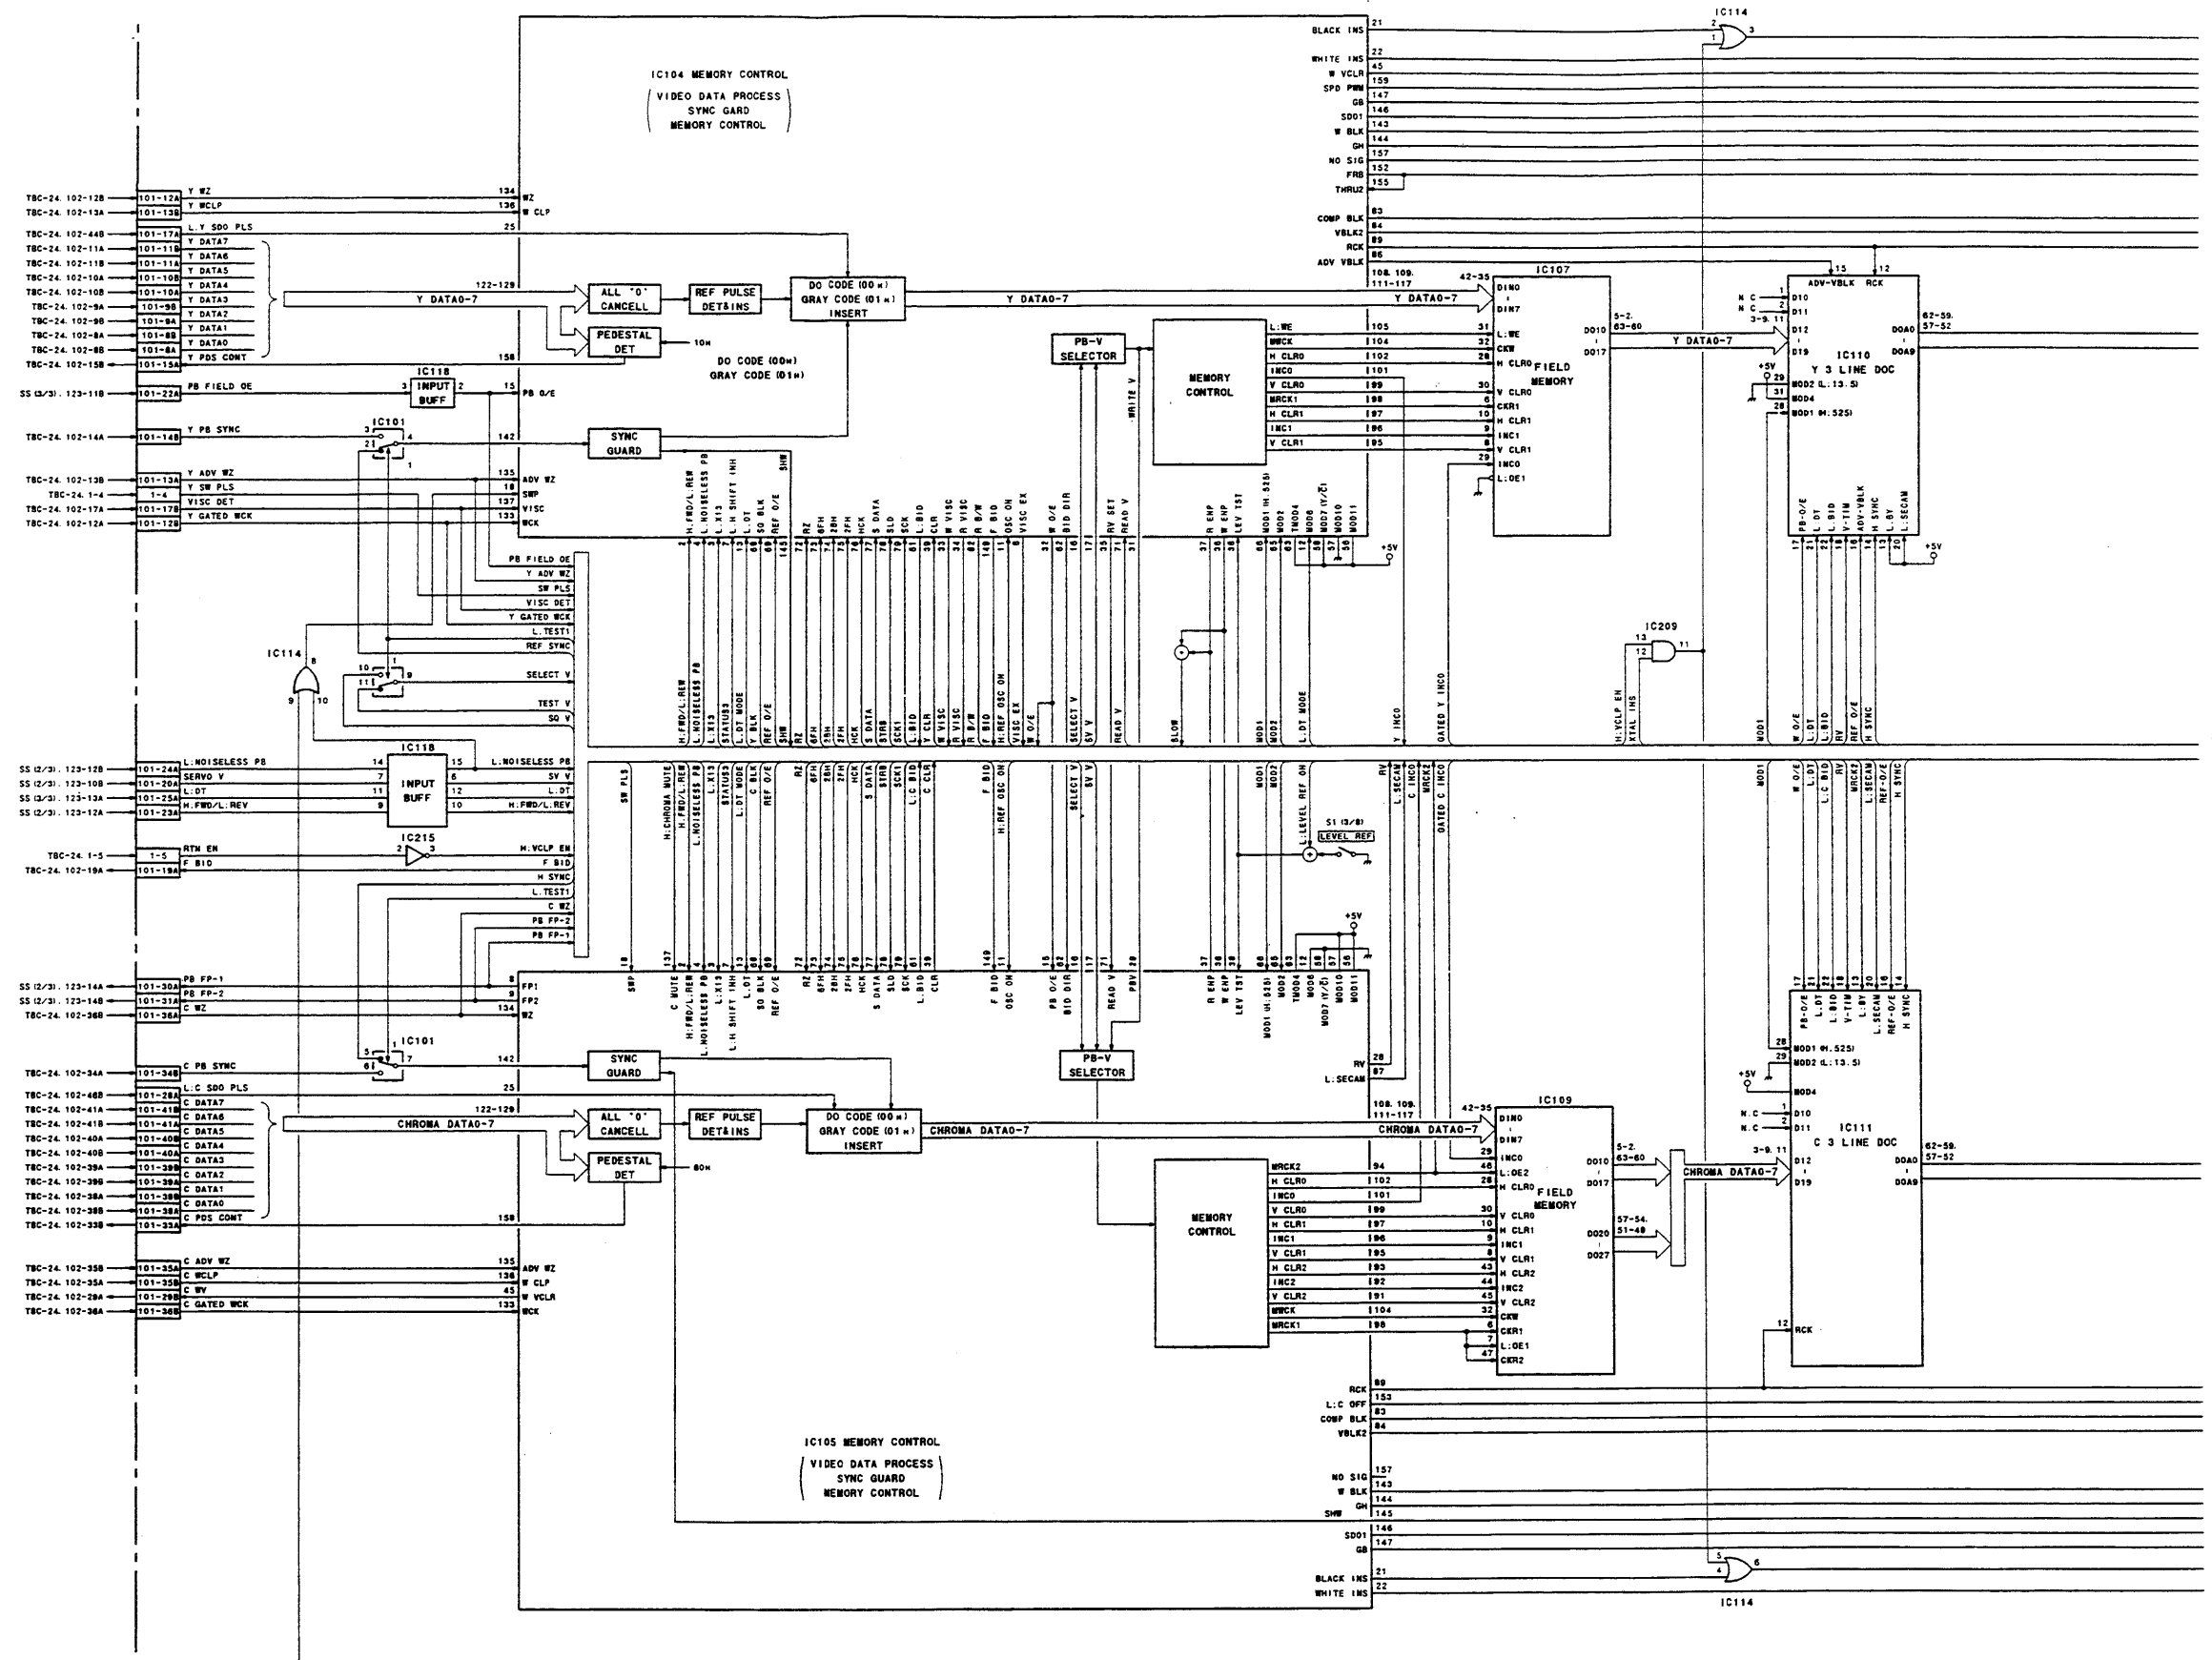

The eight-bit Y/C delay control data output from the MPU is converted into an analog "Y/C DL CONT" signal using a D/A converter (IC203) and sent to TBC-24 board. The data is then added to the phase-shift circuit in a C write clock generator circuit to shift the phase of a chroma signal and synchronize the Y and chroma signals.

The IC (IC205) called a memory sequencer receives the command from IC206, and controls a V timing signal and the phase detection of a VISC signal.

The V timing signal is controlled as described below. IC205 takes in the "PB V", "DT V", "SV V" signals, other timing signals and control information from SS-52 board, VPR-1 board, and a TBC block, generates an "SQ V" signal from the correlation of these signals, and outputs it. This "SQ V" signal is used as the reference of time base correction in the normal PB and DT PB modes.

The phase detection of the VISC signal is controlled as described below. The "VISC Y" signal that is extracted from Betacam PB data on VPR-1 board, converted from digital to analog, and fed back is sent to the VISC phase detector circuit on TBC-23 board, where the phase of a separated VISC signal is compared with the phase of a fine-adjusted REF SC signal (IC216). IC205 outputs a "VISC DET" pulse in proper timing on the basis of various signals and information. The "VISC DET" pulse turns on and off the switch in the phase comparator IC216 to sample and hold the phase compare output signal. The resultant phase error voltage is sent to TBC-24 board as an "SCH TRACKING" signal. The signal is then added to the phase-shift circuit in Y and C write clock generator circuits so as to shift the phase of the Y and C signals and to make the phase of a subcarrier (VISC) during REC coincide with that of an output subcarrier.

[CIRCUIT DESCRIPTION OF AP-28 BOARD]

AP-28 board is a Betacam PB AFM demodulator board that demodulates the AFM signal reproduced from an analog Betacam tape into an audio signal. This board also mounts a DOLBY decoding circuit for the audio signal (LAU signal) reproduced from the longitudinal tracks of the analog Betacam tape.

The outline of an AFM system is first described below.

In the Betacam SP format, the audio signals in channels 1 and 2 of four-channel audio input signals are recorded on the longitudinal tracks of the tape by an AC bias system, and the audio signals in channels 3 and 4 are recorded on chroma video tracks (track C) by an AFM system. The AFM system frequency-multiplexes FM-modulated audio signals into the FM-modulated chroma signal, then records it. The carrier frequencies of FM audio signals use frequencies lower than the carrier frequency of a chroma signal as described below.

Carrier frequency CH3 : 310 kHz, CH4 : 540 kHz

Maximum frequency deviation 75 kHz

To pay attention on AFM reproduction is that rotary heads C-A and C-B are switched in the course of continued signal because an audio signal contains no blanking period that a video signal contains. Since the switching noise of an RF signal appears as a high noise during FM demodulation, proper measures against the noise are required.

When the analog Betacam tape is reproduced by a digital Betacam VTR, the AFM signal is also reproduced in the form that its time base is compressed about 9% because of the difference of the drum diameter. Therefore, a circuit for time-base correction is added on AP-28 board.

The outline of an AFM signal processing circuit is described next.

The C RF signal that branches in the PB C input circuit on DM-89 board is sent to AP-28 board. This signal is sent to a 800-kHz low-pass filter to eliminate chroma signal components and to produce an AFM RF signal, then adjusted in level using an RF amplifier in the next stage.

The resultant signal is converted into eight-bit data using an A/D converter (IC308) and written in field memory (IC313) via a selector (IC311). The data is written four bits at a time using the selector. The reason is that the field memory consists of four bits per word. Among the data written in the field memory, the CH-A data reproduced by the C-A head is read from pins 5 to 8 four bits at a time and sent to IC312. The CH-B data reproduced by the C-B head is read from pins 35 to 32 four bits at a time and sent to IC312.

Each data mentioned above is restored to eight-bit data using the switch in IC312.

The above process is controlled by IC312. IC312 called a "digital AFM expander" functions as an "AFM TBC" circuit. IC312 controls a PLL circuit and generates a write clock locked to the C SH (C SELECT H) signal generated on TBC-24 board. Using this write clock, the A/D converter (IC308) samples the AFM RF signal and converts it into jitter-canceled data. IC312 also corrects the time base by reading data from the field memory (IC313) using a read clock that is generated from reference signal "REF CK 27".

For the RF signal recorded on the tape, CH-A and CH-B data are not completely switched every time the drum rotates by a half turn, but overlap areas of some hundreds of micro-

second are added before and after each channel. When the analog Betacam tape is reproduced by a digital Betacam VTR, data can be transmitted in one line until it is written in the field memory because the CH-A and CH-B data whose time base is compressed are alternately reproduced at slight intervals. However, when data is read from the field memory, the respective line is required because the time base is corrected.

IC312 alternately links the read CH-A and CH-B data whose time base is corrected and generates time-base corrected AFM RF data. At that time, IC312 uses two select switches for data fetching, and generates the AFM RF data with longer CH-A data and the AFM RF data with longer CH-B data and outputs them by setting high- and low-selection duty cycles and controlling them. These AFM RF data are passed through a D/A converter and 800-kHz low-pass filter, respectively.

As a result, the AFM RF signal with longer CH-A signal ("AFM 1" signal) and the AFM RF signal with longer CH-B signal ("AFM 2" signal) are produced.

The "AFM 1" and "AFM 2" signals are passed through AGC amplifier and branch into two paths, respectively. These signals are then passed through 310-kHz or 540-kHz bandpass filter and demodulator, respectively. As the result, four signals (CH3 audio signal with longer CH-A signal, CH3 audio signal with longer CH-B signal, CH4 audio signal with longer CH-A signal, and CH4 audio signal with longer CH-B signal) are produced.

Using two pairs of select switches (IC503 for CH3 and IC603 for CH4) for signal fetching, therefore, the CH-A and CH-B signal portions (not including a high demodulation noise occurring at the joint of RF signals) are alternately fetched and linked under the control from IC312.

After that, both signals are amplified and passed through 25-kHz low-pass filter, respectively, then sent to a noise reduction circuit (IC701) to produce noise-free AFM demodulation audio signals ("B PB CH3" and "B PB CH4"). The produced signals are sent to APR-1 board.

When a dropout occurs in the AFM RF signal, it is detected in the AGC amplifier (IC403) for the "AFM 2" signal. The dropout portion is temporarily held in each demodulator according to the dropout information, and the relevant portion of a demodulated audio signal is interpolated linearly.

Lastly, an LAU signal processing circuit is described below. The audio signals reproduced from the longitudinal tracks of the analog Betacam tape are equalized in a frequency characteristic on CUE-1 board and sent to AP-28 board. On AP-28 board, the input audio signals are compensated in the undulation of a low-frequency response using contour effect compensator, respectively. After that, the phases in both channels are adjusted using a phase adjustment circuit. The resultant audio signals are sent through 15-kHz low-pass filters to a DOLBY C noise reduction IC (IC105), where the audio signals are DOLBY-decoded and output, then sent to APR-1 board as "B PB CH1" and "B PB CH2" signals.

[CIRCUIT DESCRIPTION OF SS-52 BOARD (1/3)]

SS-52 board (1/3) is a system control system block that controls man-machine interface, processor control, and overall system.

SS-52 board consists of the following blocks.

- SS-52 (1/3): System control system block
- SS-52 (2/3): Servo control system block
- SS-52 (3/3): DT control system block

These blocks incorporate CPUs (MPU), respectively, and control their own system while they communicate mutually via dual port RAMs. Especially, the system control system controls the overall system as well as its own system.

The system control system is described below.

The outline of the system control system is first described.

The CPU system which constitutes the center of the system control system consists of main and sub CPU systems. The main CPU (IC5) controls the basic functions for peripheral boards and the overall system. The sub CPU (IC50) controls the key panel including the time counter display.

The flow of the controls performed by each CPU are summarized as described below.

Main CPU

- CPU system configuration : Main CPU (V25)(IC5)
 - Address decoder (IC7(2/2))
 - ROM (256k bytes)(IC12)
 - RAM (32k bytes)(IC10)
 - NOVRAM (8k bytes)(IC13)
 - Interrupt controller (IC16)
- Communicates with the sub CPU via dual port RAM (IC37 and IC38).
- Communicates with the servo CPU via dual port RAM (IC34 and IC35).
- Controls DPR-36 board while exchanging the system data and control signals ("PAD 0 to 7/CONT") via parallel bus interface (IC28, IC29, and IC30).
- Controls EQ-45 board via RF block interface (IC7(1/2) and IC8).
- Controls APR-1, FP-58, SWC-19, and RM-130 boards via MPU communication controller (IC25 and IC22).
- Controls VPR-1, DM-89, and TBC-23 boards via MPU communication controller (IC27 and IC26).
- Controls the superimpose IC (IC46) via the circuit mentioned above to send character signals to VPR-1 and DIF-16 boards.
- Controls the LTC processor IC (IC42) to generate and read the LTC signal.
- Communicates with the outside via a serial interface (IC15) by the RS-232C protocol (using the RS-232C connector).

Sub CPU

- CPU system configuration : Sub CPU (Z80)(IC50)
 - Address decoder (IC53(1/2))
 - ROM (64/256k bytes)(IC54)
 - RAM (8k bytes)(IC52)
- Communicates with the main CPU via dual port RAM (IC37 and IC38).
- Controls the key panel (overall lower control panel including the time counter display and search dial assembly) by the serial communication with the MPU on KY-231 board.

- Communicates with the outside via a remote interface (IC53(2/2)) by the RS-422 protocol (using the 9-pin remote connector).
- Sends a watchdog reset pulse to the main CPU when an error is detected during communication with the main CPU.

A few complementary explanation is given for the contents of the above description.

(1) NOVRAM

The NOVRAM (IC13) is used as an error logger that saves the data at that time when each error occurs. This RAM has no backup function.

(2) RF block interface

The RF block interface (IC7(1/2) and IC8) reads the D/A converter control data set in the RAM, converts the data into the serial data ("SYIF1 CMD") in which four-bit D/A channel numbers are added, and sends it to EQ-45 board together with a clock signal and strobe signals, to set the various control data to the three 12-channel D/A converter on EQ-45 board.

The RF block interface also counts the metric pulses from the VITERBI ICs on EQ-45 board, using the head select signals as the gate windows, and sends the count data to the CPU. The CPU controls the gain and phase of each equalizer circuit so that the metric pulses decrease.

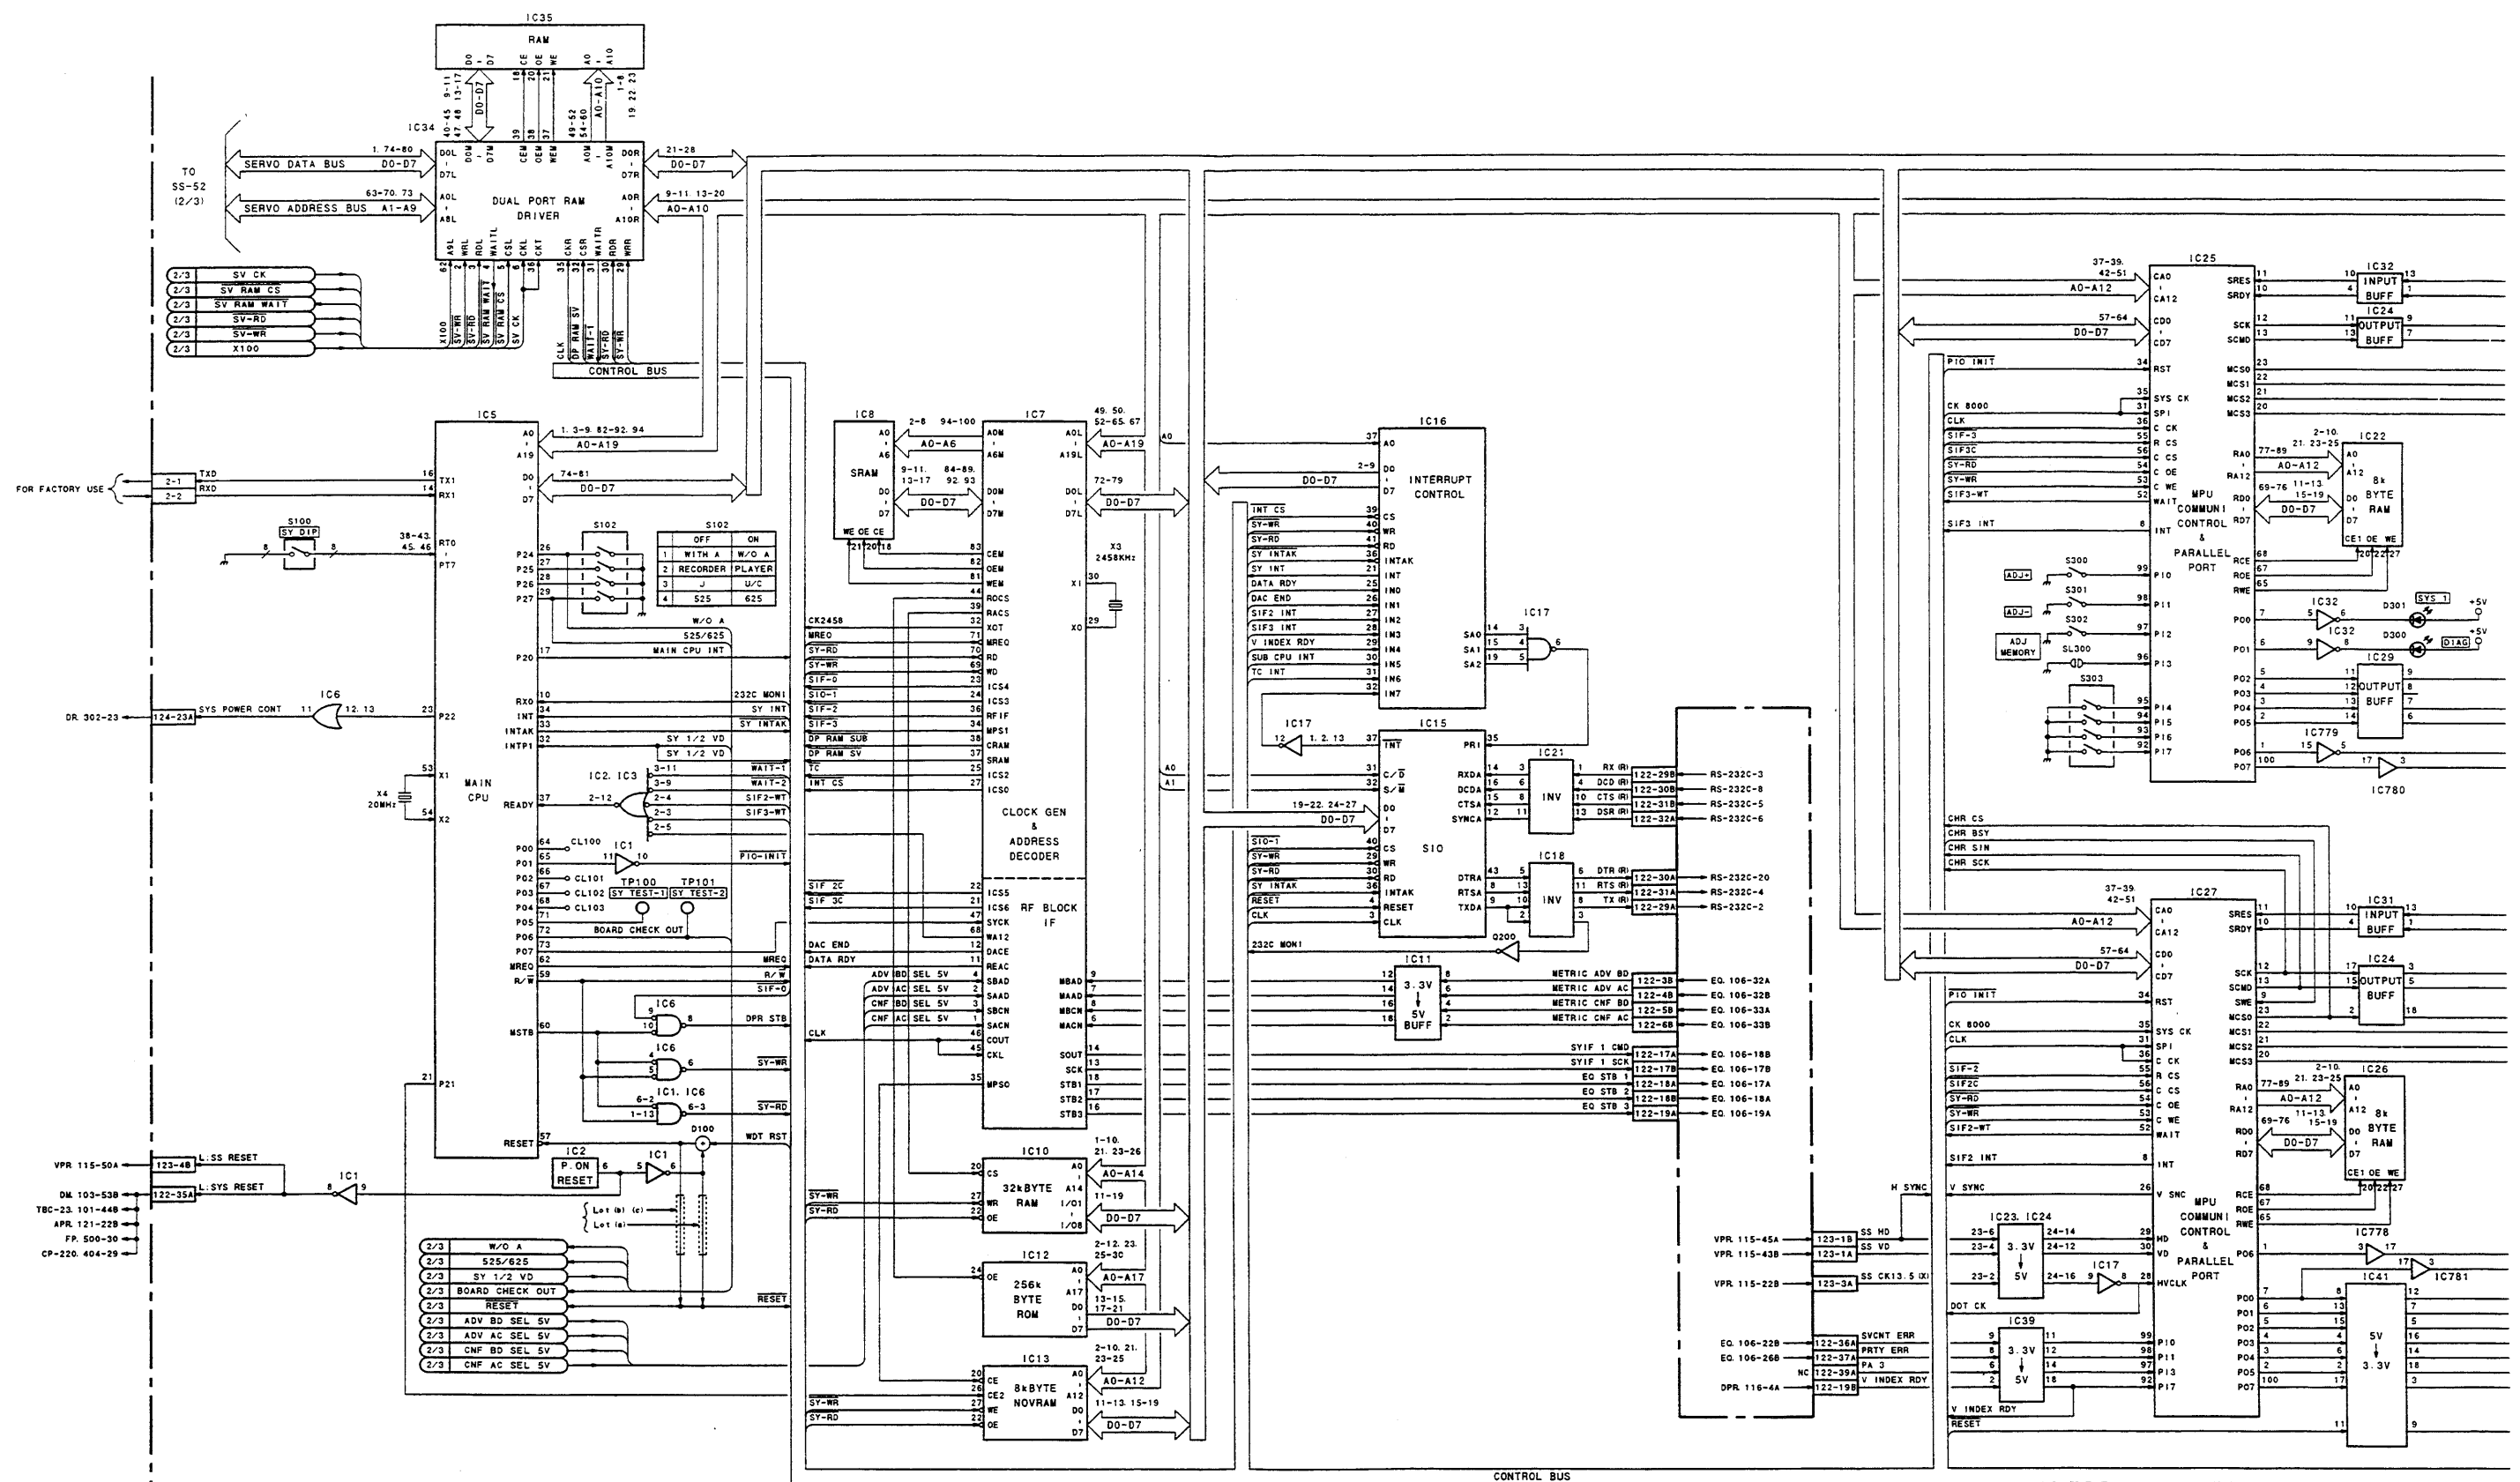

(3) MPU communication controller

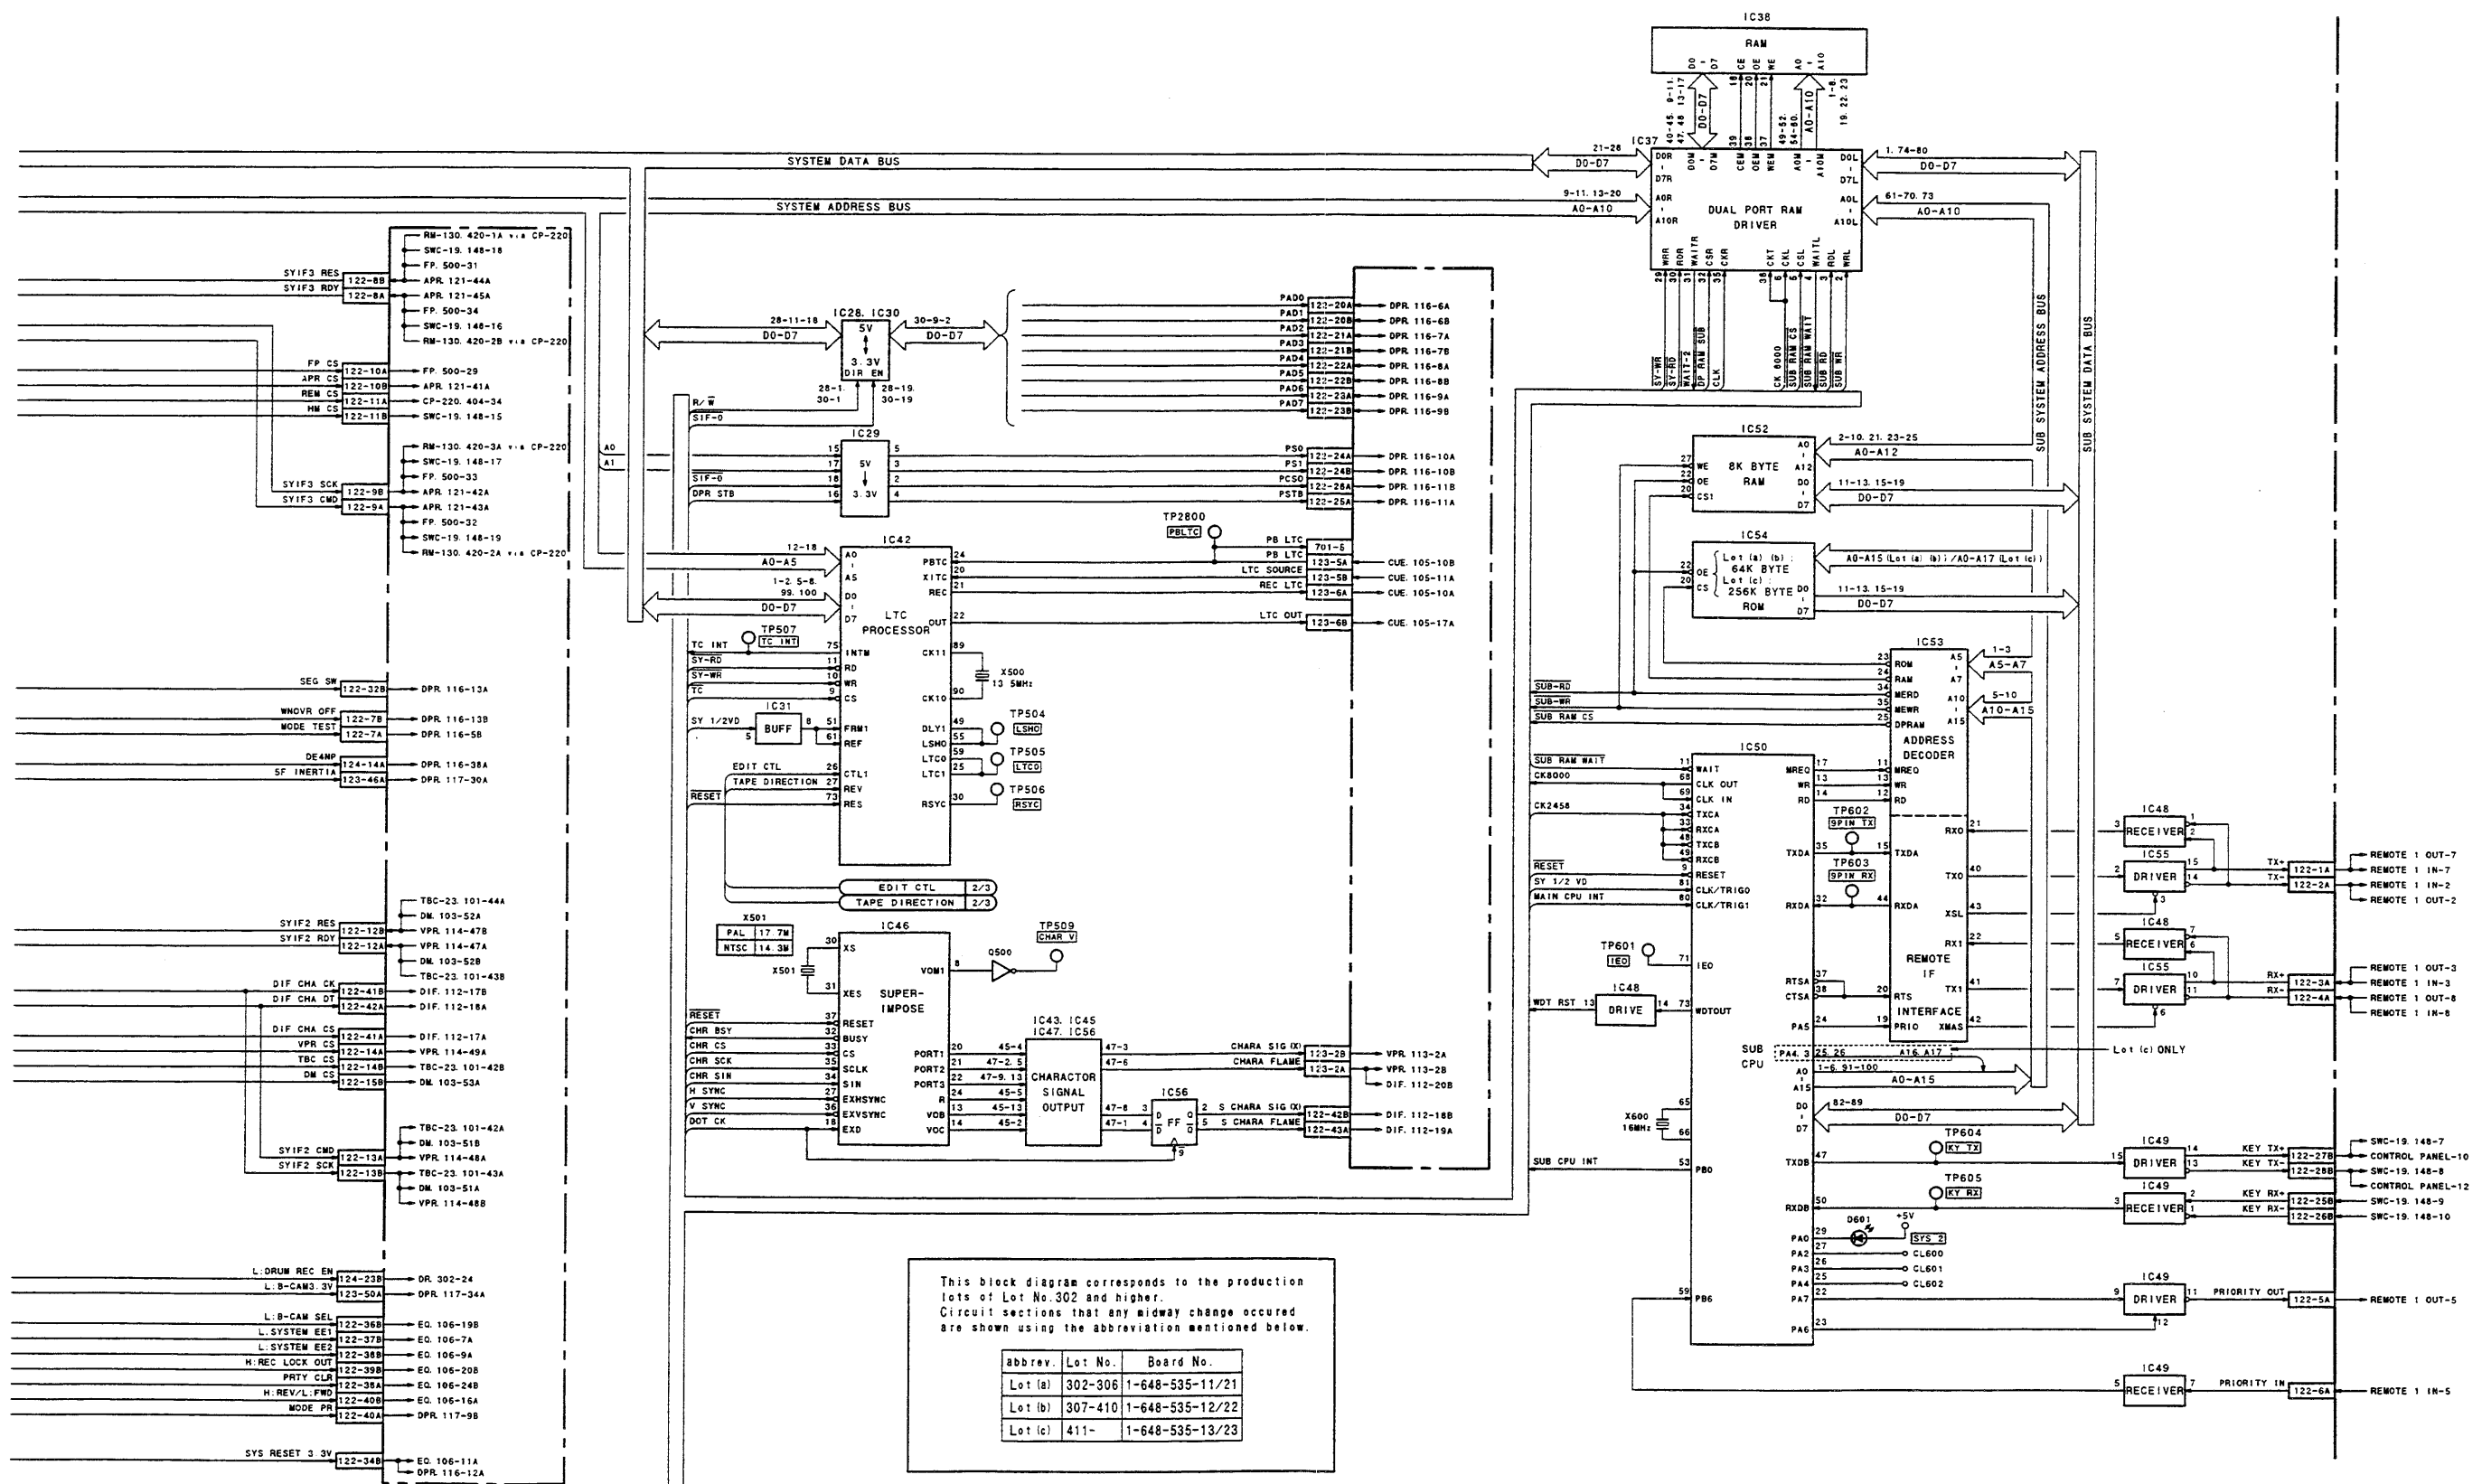

The MPU communication controllers (IC25 and IC22, and IC27 and IC26) can communicate with eight MPUs (maximum) by serial communication, respectively. IC25 sends a "SYIF3 CMD" command to each board together with a clock signal and chip select signals, and IC27 sends a "SYIF2 CMD" command to each board together with a clock signal and chip select signals. These commands control the basic function of the MPUs on each board.

The MPU communication controller also have 16 parallel ports (eight input ports and eight output ports). These ports are used for the input operations by switches, and the signal exchange between DPR-36 or EQ-45 board and the CPU.

For each CPU, LEDs that display each operation state are mounted on the board.

D301 displays the operation state of the main CPU, and D601 displays the operation state of the sub CPU. Each LED blinks at intervals of approximately 1 Hz if the operation state is normal.

[CIRCUIT DESCRIPTION OF SS-52 BOARD (2/3)]

SS-52 board (2/3) is a servo control system block that gathers the feedback information from sensors and mechanical devices, performs detection processing for the information, and controls the mechanical devices via DR-307/200 board according to the result of the detection.SS-52 board (2/3) also mounts an SAT control circuit that slightly differs from the general servo control.

The configuration of the servo control system block is summarized below.
The servo CPU system (IC750, etc.) constitutes the center of the servo control system, and controls the overall servo system. The servo CPU connects with the servo IC (IC774) and two I/O ports (IC762 and IC782) by data bus, and connects with the drum MPU (IC700), MPU on DR-307/200 board, and SAT IC (IC1003) by serial communication.

The outline of each portion is described below.

(1) Servo CPU system

CPU system configuration : Servo CPU (16-bit)(IC750)
Address decoder (IC756, IC757, etc.)
ROM (4M-16 bits)(IC761)
RAMs (2k bytes x 2)(IC751 and IC758)
The servo CPU constitutes the center of the servo control system. It controls the servo system except a DT function. This servo CPU communicates with the CPU of the system control system via the dual port RAM (IC34 and IC35) (on SS-52 board(1/3)) and communicates with the CPU of the DT control system via dual port RAM (IC2113 and IC2115) (on SS-52 board(3/3)).
The servo CPU has serial ports, so communicates with the drum MPU (IC700) and the MPU on DR-307/200 board in serial, and controls these MPUs.
It also controls the SAT IC (IC1003) via the I/O port (IC782) connected using a data bus by serial communication.
The servo CPU has analog input terminals, so takes in motor currents, tape tensions, and other analog data, and converts them into digital data. Moreover, it takes in digital data and detection data via the MPU on DR-307/200 board and the servo IC (IC774), and controls the servo according to these data items.

(2) Servo IC

The servo IC (IC774) receives the CTL signal and various FG pulse signals that are fed back from DR-307/200 board, calculates the timing, and outputs PWM signals for each motor control to DR-307/200 board.
However, the PWM signal output from pin 31 provides a speed offset for the PLL circuit in the VITERBI processing system on EQ-45 board. The pulse width of this PWM signal varies depending on the tape speed. This signal is DC-converted using IC765, then time-shared into four PB RF identifying DC signals using analog switches (IC771 and IC775), and sent to EQ-45 board.
In addition to the above description, the servo IC also detects the rotating direction of the capstan motor, generates a 1/2 VD pulse, and outputs them.

(3) Drum MPU

The drum MPU (IC700) sends a PWM signal for drum motor control to DR-307/200 board under the control of the servo CPU, and outputs the select signals for each rotary head to EQ-45 and DPR-36 boards and the ENABLE signal for the flying erase head to EQ-45 board.

(4) SAT control circuit

SAT is the abbreviation for "Supplemental Automatic Tracking". The SAT control system is a new automatic tracking system that uses the "TRACKING PILOT" signals shown in Fig. 2-2-2 in Section 2. This system supplements the conventional tracking servo function that uses only the CTL signal, ensuring an accurate tracking during editing. For the "TRACKING PILOT" signals, a signal of 400 kHz is recorded before the audio sectors, and a signal of 4 MHz is recorded after the audio sectors. The "TRACKING PILOT" signals are not erased during insert editing. At present, only the SAT signal that is reproduced from track A by the REC head is used as the reference signal for the tracking servo.
The SAT RF signal reproduced by the REC A head is sent from EQ-45 board. This signal is passed through an RF amplifier (IC1102), then separated into 400 kHz and 4 MHz components using a bandpass filter.
The 400 kHz component is sent to the SAT IC (IC1003), shaped, and sent to the servo IC (IC774) as a timing pulse so as to detect the time difference between the component and the drum PG pulse. The result data is fed back to the tracking servo.
The 4 MHz component is envelope-detected using IC1107, sampled and held using a timing pulse from the drum MPU (IC700), and sent to the servo CPU (IC750) as envelope data.
This data is then fed back to the tracking servo so that it is maximized.
In the REC mode, the SAT IC (IC1003) generates SAT REC signals under the control of the servo CPU, sends it to EQ-45 board together with an ENABLE signal, and sends a START pulse, that reports the track's write start, to DPR-36 board.
In the PB mode, the SAT IC shapes the SAT PB signal into a timing pulse as described above and sends it to the servo IC.

(5) CPU operation state display by LED

For each CPU, LEDs that display each operation state are mounted on the board. D711 displays the operation state of the servo CPU, and D800 displays the operation state of the drum MPU. Each LED blinks at intervals of approximately 1 Hz if the operation state is normal.
Moreover, D800 displays the drum operation state by the duty cycle of the blink. The operation of the LED that lights for a longer time indicates "DRUM LOCK". The operation of the LED that goes off for a longer time indicates "DRUM UNLOCK".

[CIRCUIT DESCRIPTION OF SS-52 BOARD (3/3)]

SS-52 board (3/3) is a DT control system block that detects a tracking error from the PB signal of the DT head, generates a bimorph drive signal together with the feedback data processing result, and sends it to DT-34 board (bimorph drive board) for dynamic tracking.

DT control system configuration

- DT system control block
 - DT CPU system
 - Servo IC
- Tracking error detection block
 - Wobbling signal generator circuit
 - Digital tracking error detector circuit
 - Analog tracking error detector
- Bimorph control block
 - Bimorph control circuit
 - Bimorph drive circuit (DT-34 board)

The outline of each block is described below.

(1) DT system control block

The DT system control block consists of a DT CPU system (consisting of a DT CPU (IC2104), address decoder (IC2108), ROM (IC2110), and I/O port (IC2109)) and a servo IC (IC2200).

The DT CPU communicates with the servo CPU via the dual port RAM (IC2113 and IC2115), performs detection processing for the feedback data jointly with the servo IC, and controls the DT system according to the result.

The servo IC detects the tape speed from capstan FG signals, calculates the timing of the tracking from a CTL PB signal, and sends the calculated tracking data and others in the form of PWM signal to the bimorph control circuit.

(2) Tracking error detection block

Since a digital Betacam tape has a narrow track width and high trace speed, the degree and direction of a tracking error are detected from the envelope waveform of a PB RF signal by wobbling the DT head (ADVANCE head) in the PB mode. For an analog Betacam tape, the tracking data generated in the DT system control block is corrected from the PB RF level detection and from the PB phase difference detection between channels Y and C by IC2401, as before.

• Wobbling signal generator circuit

Wobbling data is generated by three CTC counters (IC2202, IC2204, and IC2207), converted into a wobbling signal of 1.5 kHz by a D/A converter (IC2210), and added to bimorph drive signals in the mode of "WOBBLING ON".

The timing pulses generated by the above CTC counters are sent through an wobbling control circuit (IC2100, IC2205, and IC2209) to the tracking error detector circuit to control the timing of the error detection.

• Digital tracking error detector circuit

The ADVANCE head is wider in width than the REC head. Two ADVANCE heads are installed on one bimorph plate in pairs so that the portions of the remaining width protrude from the both outsides of the tracks recorded in pairs.

When the bimorph plate wobbles, if the head deflects to the outside of pair tracks, the track width that can be reproduced decreases. Therefore, the amplitude of the PB RF signal decreases.

If the head deflects to the inside of pair tracks, the portion of the head got in the adjacent track cannot reproduce because the azimuth angle differs. However, since the outer edge of the track is covered by the portion of the remaining width of the head, the track width that can be reproduced does not change. For the adjacent head, the same change described above appears in an opposite phase.

If a tracking error occurs, the above change appears more remarkably in the shifted outside head. In the inside head, the change decreases. Therefore, a wobbling component (1.5 kHz) is extracted from the envelope waveform of the PB RF signal in each head, and the difference is obtained using a differential amplifier. As a result, the degree and direction of the tracking error can be detected.

IC2500 to IC2508 are a digital tracking error detector circuit. For the envelope waveform of the PB RF signal from EQ-45 board, only the video RF portion is extracted in the timing of the "PEAK HOLD OFF" signal from a wobbling control circuit, and a wobbling component is taken out using a bandpass filter of 1.5 kHz and half-wave rectified. The resultant half-wave rectification output signals in a pair channel are input to the differential amplifier to taken out the difference and passed through a low-pass filter. As the result, a DC voltage whose polarity and dimensions correspond to the direction and degree of the tracking error is obtained. This voltage is fed back to the bimorph control circuit in the corresponding channel in the mode of "WOBB A/B ON" or "WOBB C/D ON".

(3) Bimorph control block

IC2300 to IC2305 and IC2700 to IC2705 are a bimorph control circuit. In principle, the feedback strain gauge signal and the tracking data calculated by a DT system control block are compared using phase compensators (IC2300 and IC2700), and the difference voltage is output as a bimorph drive signal.

Tracking error detection data is fed back in the course of a tracking data circuit for a digital tape to correct the tracking data. For an analog tape, the tracking error detection data is fed back to the DT system control block to correct the tracking data. Moreover, for a digital tape, a wobbling signal is added to the bimorph drive signal.

An "STG OFFSET" signal contains a same noise component as in the strain gauge signal and is used to cancel the noise. The gain adjustment is performed by changing the ON/OFF duty cycle of a charge/discharge switch by a PWM signal. A "TRACK SIGN" signal inverts the polarity of a "TRACKING" signal. The band eliminators (IC2305 and IC2705) in the later stage are used to eliminate bimorph resonant frequency component of 700 to 800 Hz.

SS-52 Board -A Side-

BETACAM PB SYSTEM ONLY

SS-52 (3/3) BOARD

DT-34 BOARD

[CIRCUIT DESCRIPTION OF DR-200 BOARD]

DR-200 board is a servo driver board that drives the mechanical devices of each mechanical block under the control from a servo control block (on SS-52 board (2/3)), receives various sensor and FG signals, and feeds them back to the servo control block. DR-200 board also mounts the REC/PB amplifier of a CTL signal.

The configuration of DR-200 board is summarized as described below.

- Four-bit MPU (IC3) that exchanges data and commands with the servo CPU on SS-52 board (2/3) by serial communication.
- Four switching drivers that drive the motors (drum, capstan, and supply and take-up reel motors) in the tape transport system.
- Three two-way switch drivers that drive the motors (loading, position, and cassette compartment up/down motors) in the loading system.
- Five drive amplifiers that drive the solenoids (pinch, supply and take-up reel brake, and cleaning solenoids) and CC lamp.
- Wave shaping amplifiers of each FG pulse (drum, capstan, supply and take-up reel, and loading FGs).
- Detection amplifiers of tape tensions (supply and take-up tensions).
- Detection amplifier of tape ends (tape top and end).
- CTL signal REC/PB amplifier.

A complementary explanation is given for the contents of the above description.

(1) Servo driver MPU

The serial data from the servo CPU on SS-52 board is converted into parallel data by this MPU (IC3) and sent to each block on DR-200 board. This data is partially used to drive the solenoids via drive amplifiers. The signal that is fed back from each sensor is sent to this MPU as parallel data, converted into serial data, and sent to the servo CPU on SS-52 board.

Two EEPROMs (IC10 and IC25) save the servo- and DT-related adjustment data under the same contents and back up it mutually.

(2) Tape transport system motor drive

The drum motor, capstan motor, supply reel motor, and take-up reel motor that constitute the tape transport system require a high-precision control. Therefore, motor drivers for these motors receive the control signals that are sent from SS-52 board by PWM signals and perform the analog drive control by switching drivers.

That is, the chopper type switching regulator (drive voltage generator circuit) that uses a PWM power controller IC converts the voltage of +18 V supplied from the power supply block into the voltage proportional to the control signal from SS-52 board to control the motor speed.

Take the case of the drum motor driver so as to describe the theory of the switching regulator. The “DRUM PWM” control signal from SS-52 board is sent to a low-pass filter (IC39) to produce a DC signal and compared with the voltage that is fed back from the output side of the regulator in the input stage of a PWM power controller (IC700). As

the result, a PWM pulse whose pulse width varies depending on the difference voltage (error voltage) is output from IC700. This pulse drives the gate of a switching FET (Q106) via IC8. When Q106 is OFF, the current flows continuously through a flywheel diode (D102) into the inductor to charge the capacitor, by the current energy holding effect of inductor. The balanced output voltage value varies with the modulation ratio of a PWM pulse and the capacity of an output current. However, the modulation ratio of the PWM pulse is controlled so that the output voltage becomes a control target value by feeding an output voltage back to IC700.

The basic operation of the switching regulator is as described above. Since the drum motor is a three-phase brushless motor, a three-phase switching circuit that supplies a current to each winding according to the three-phase control signal (output signal of Hall device amplifier) from the drum is provided after the switching regulator.

The capstan motor incorporates a three-phase switching circuit. The rotating direction of the capstan motor is directly switched by the “CAPSTAN MOTOR DIR” signal that is sent from SS-52 board via DR-200 board. Therefore, the capstan motor operates by only sending a drive voltage from DR-200 board.

The switching regulator uses an output current detection voltage for a fed back voltage and functions as a current control type regulator.

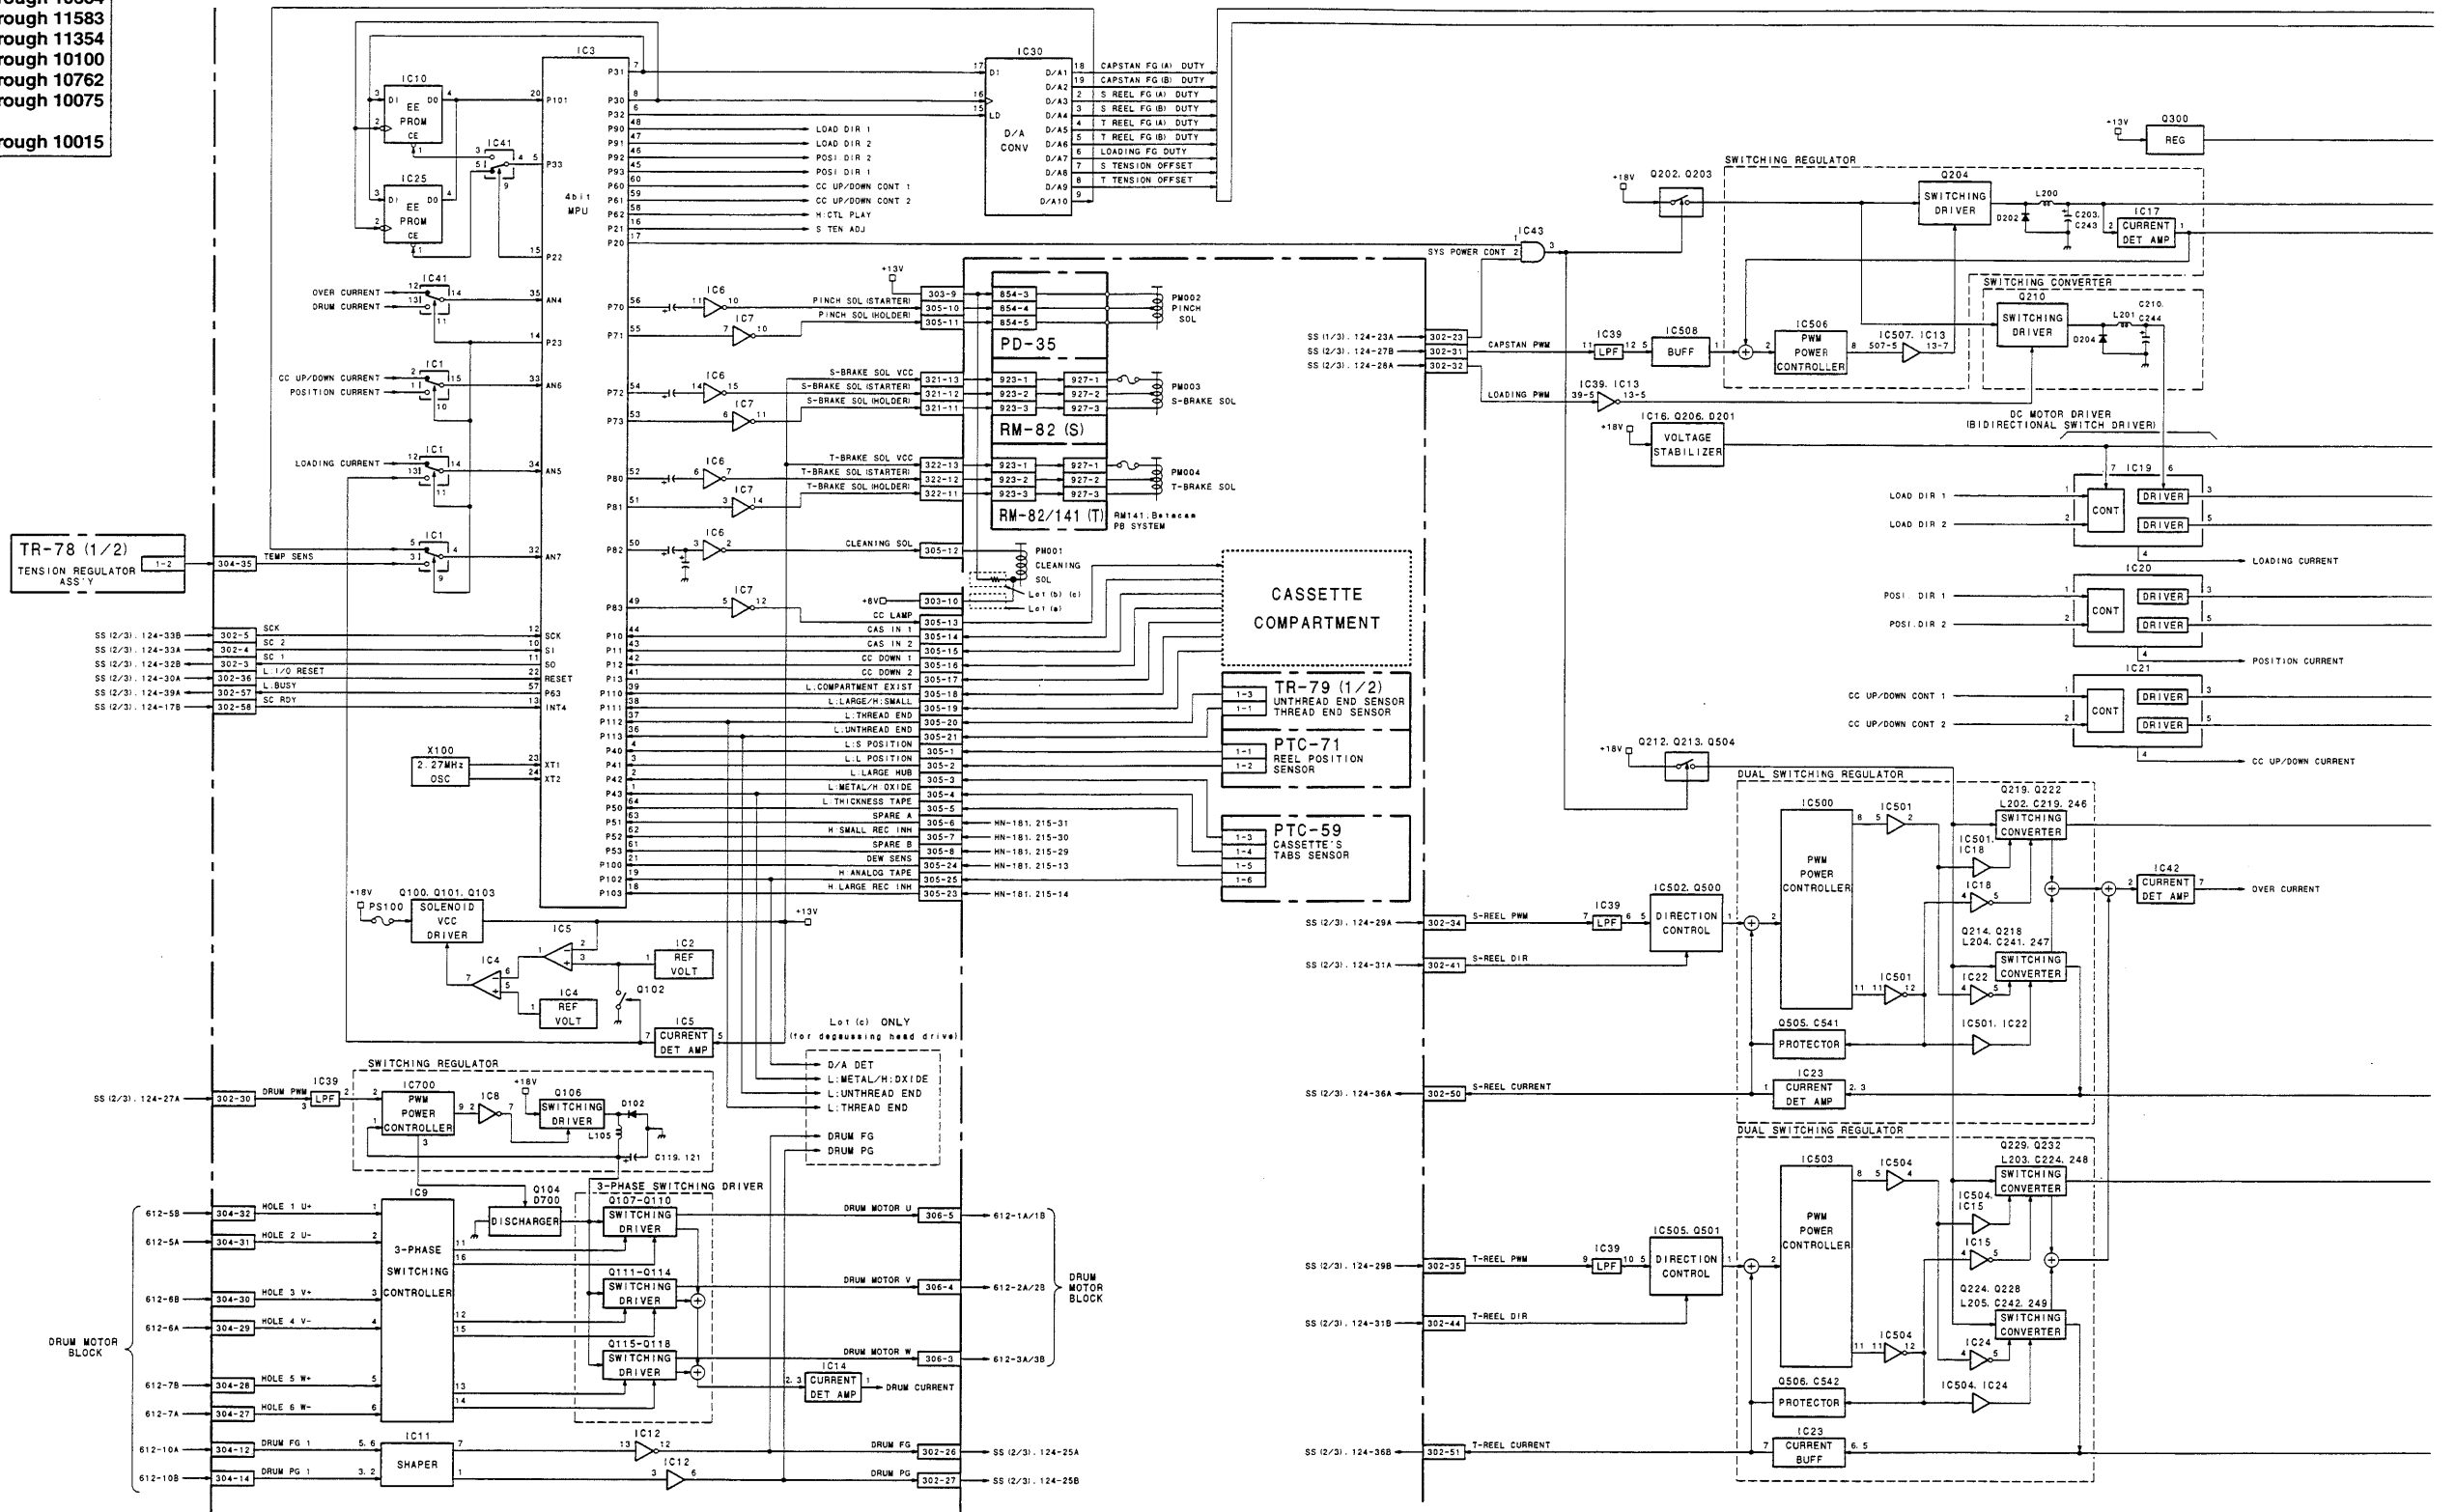

The reel motor driver is a dual switching regulator in which switching regulators are connected to both terminals of a DC motor. This reel motor driver feeds back the detection voltage of an output current occurring due to the voltage difference at both terminals to control each output voltage. The PWM power controller outputs an in-phase PWM pulse from pins 8 and 11, fluctuates the voltages at both terminals in the opposite direction according to the duty cycle ratio of the PWM pulse, and drives the motor differentially. In each switching converter that constitutes this regulator, a switching FET that makes a complementary pair with a drive switching FET is used instead of the flywheel diode.

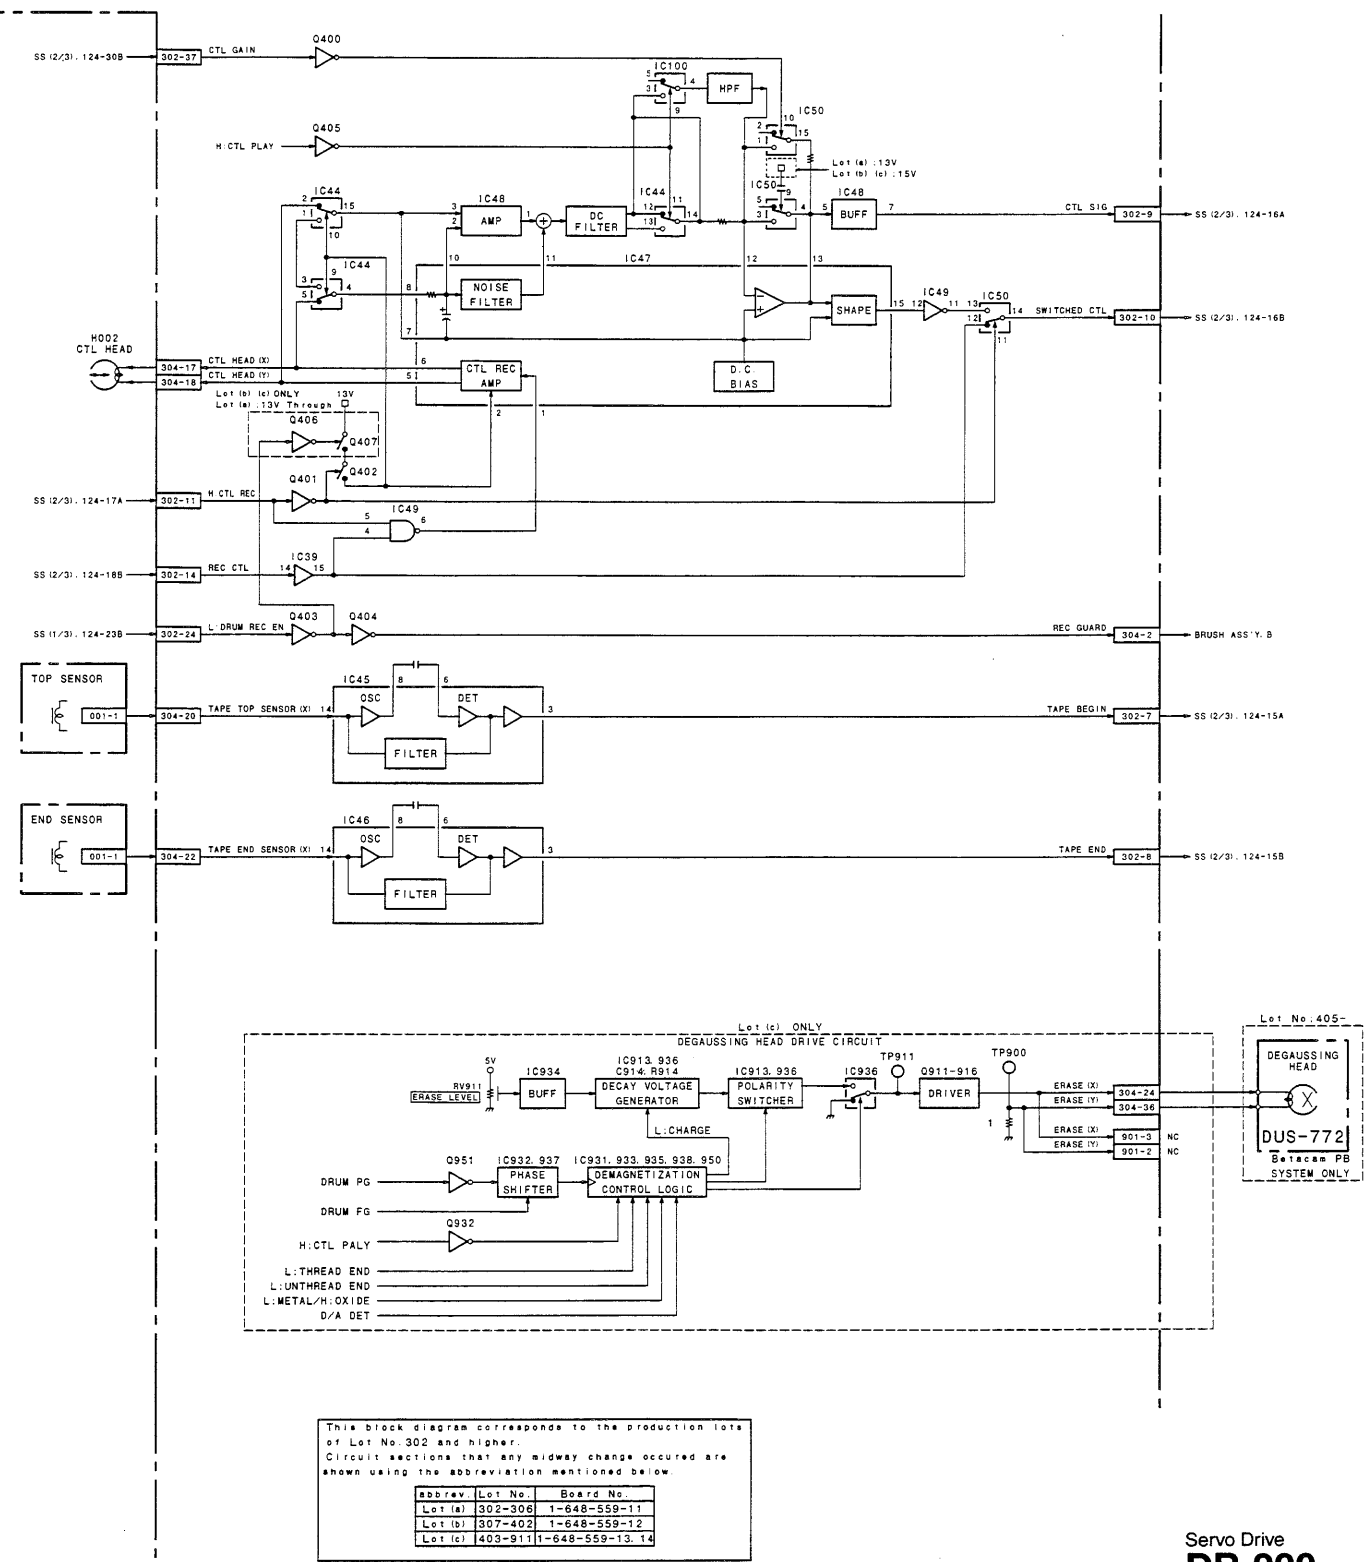

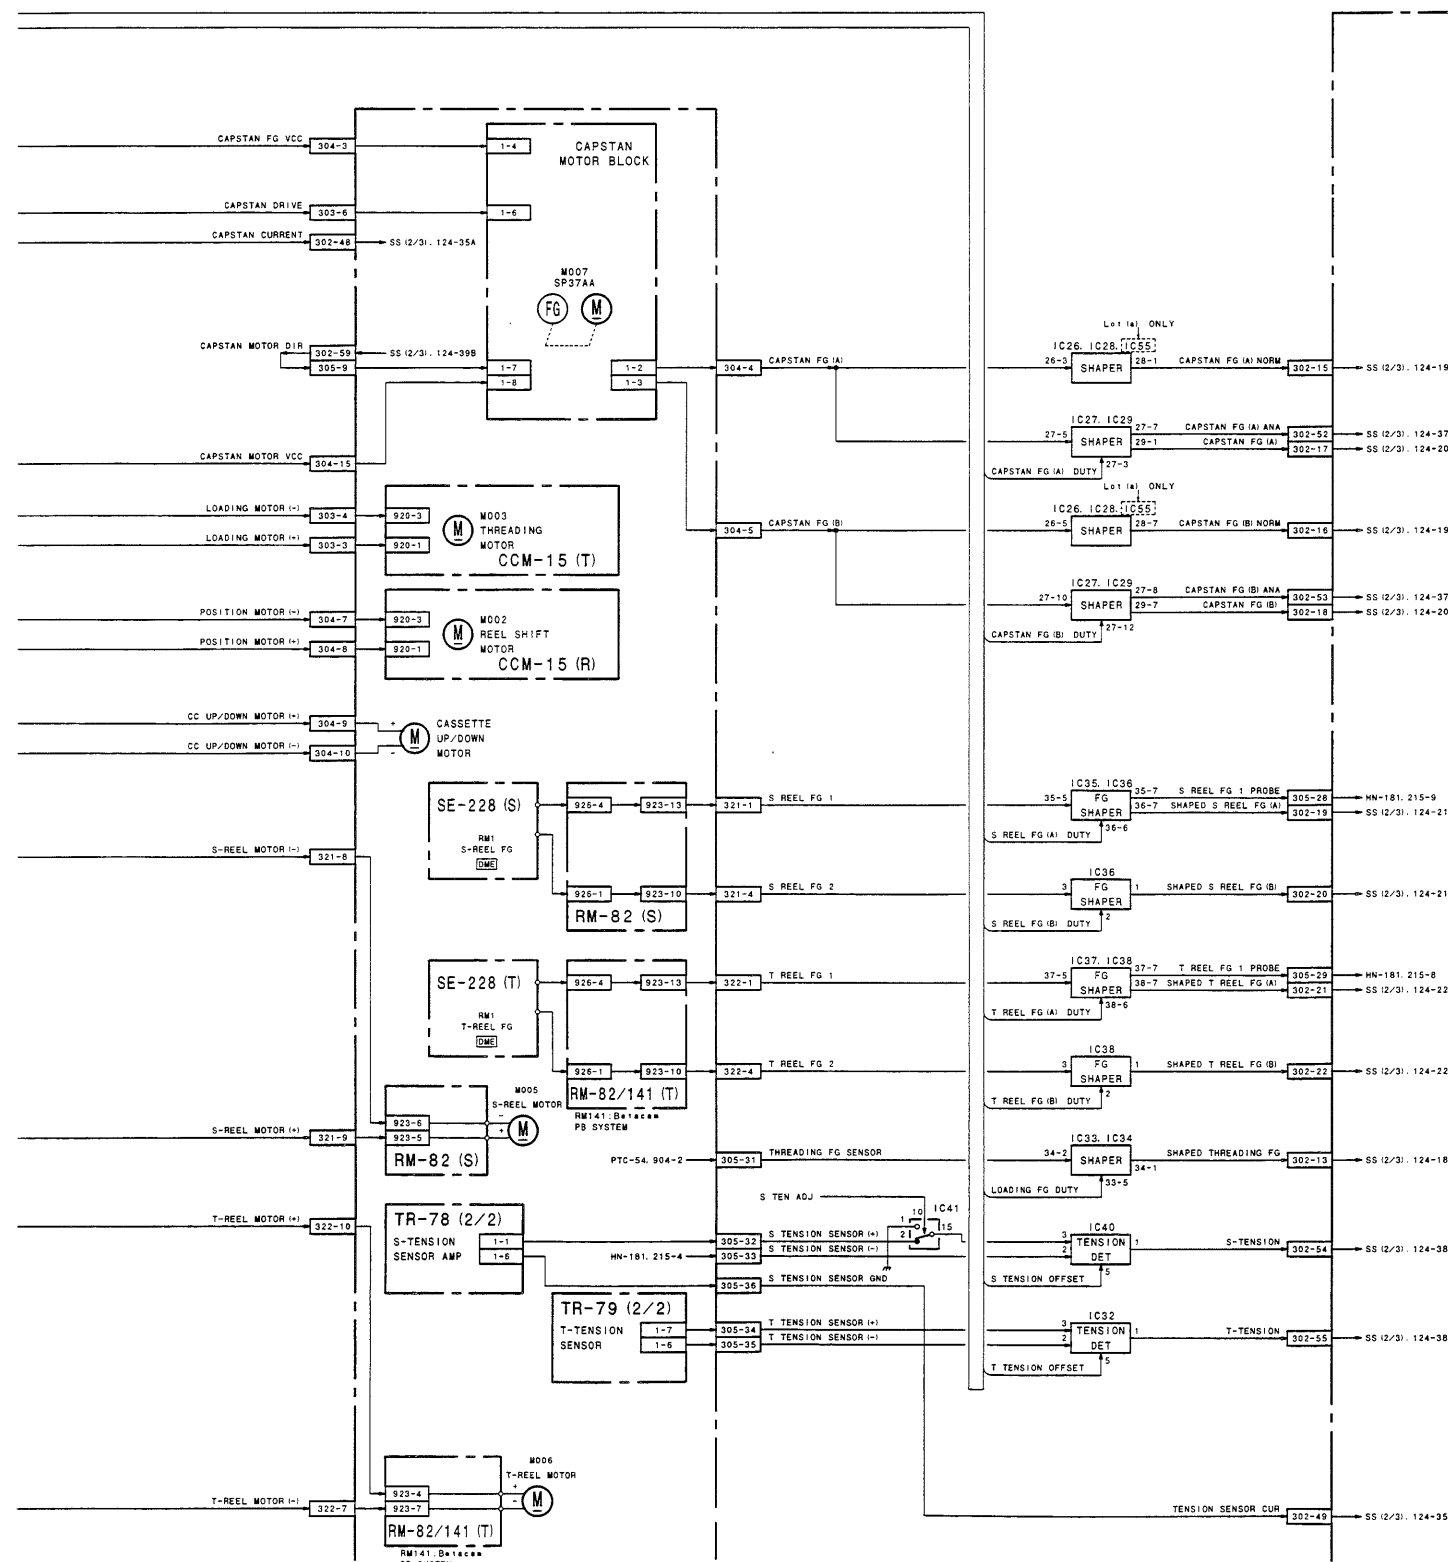

(3) Loading system motor driver

For the motors in the loading system, there are a loading motor (threading motor), position motor (reel shift motor), and cassette compartment motor (up/down motor). These motor are DC motors and are driven by two-way switch driver ICs. This IC can select four states (forward rotation, reverse rotation, short-brake, and open) by two control lines.

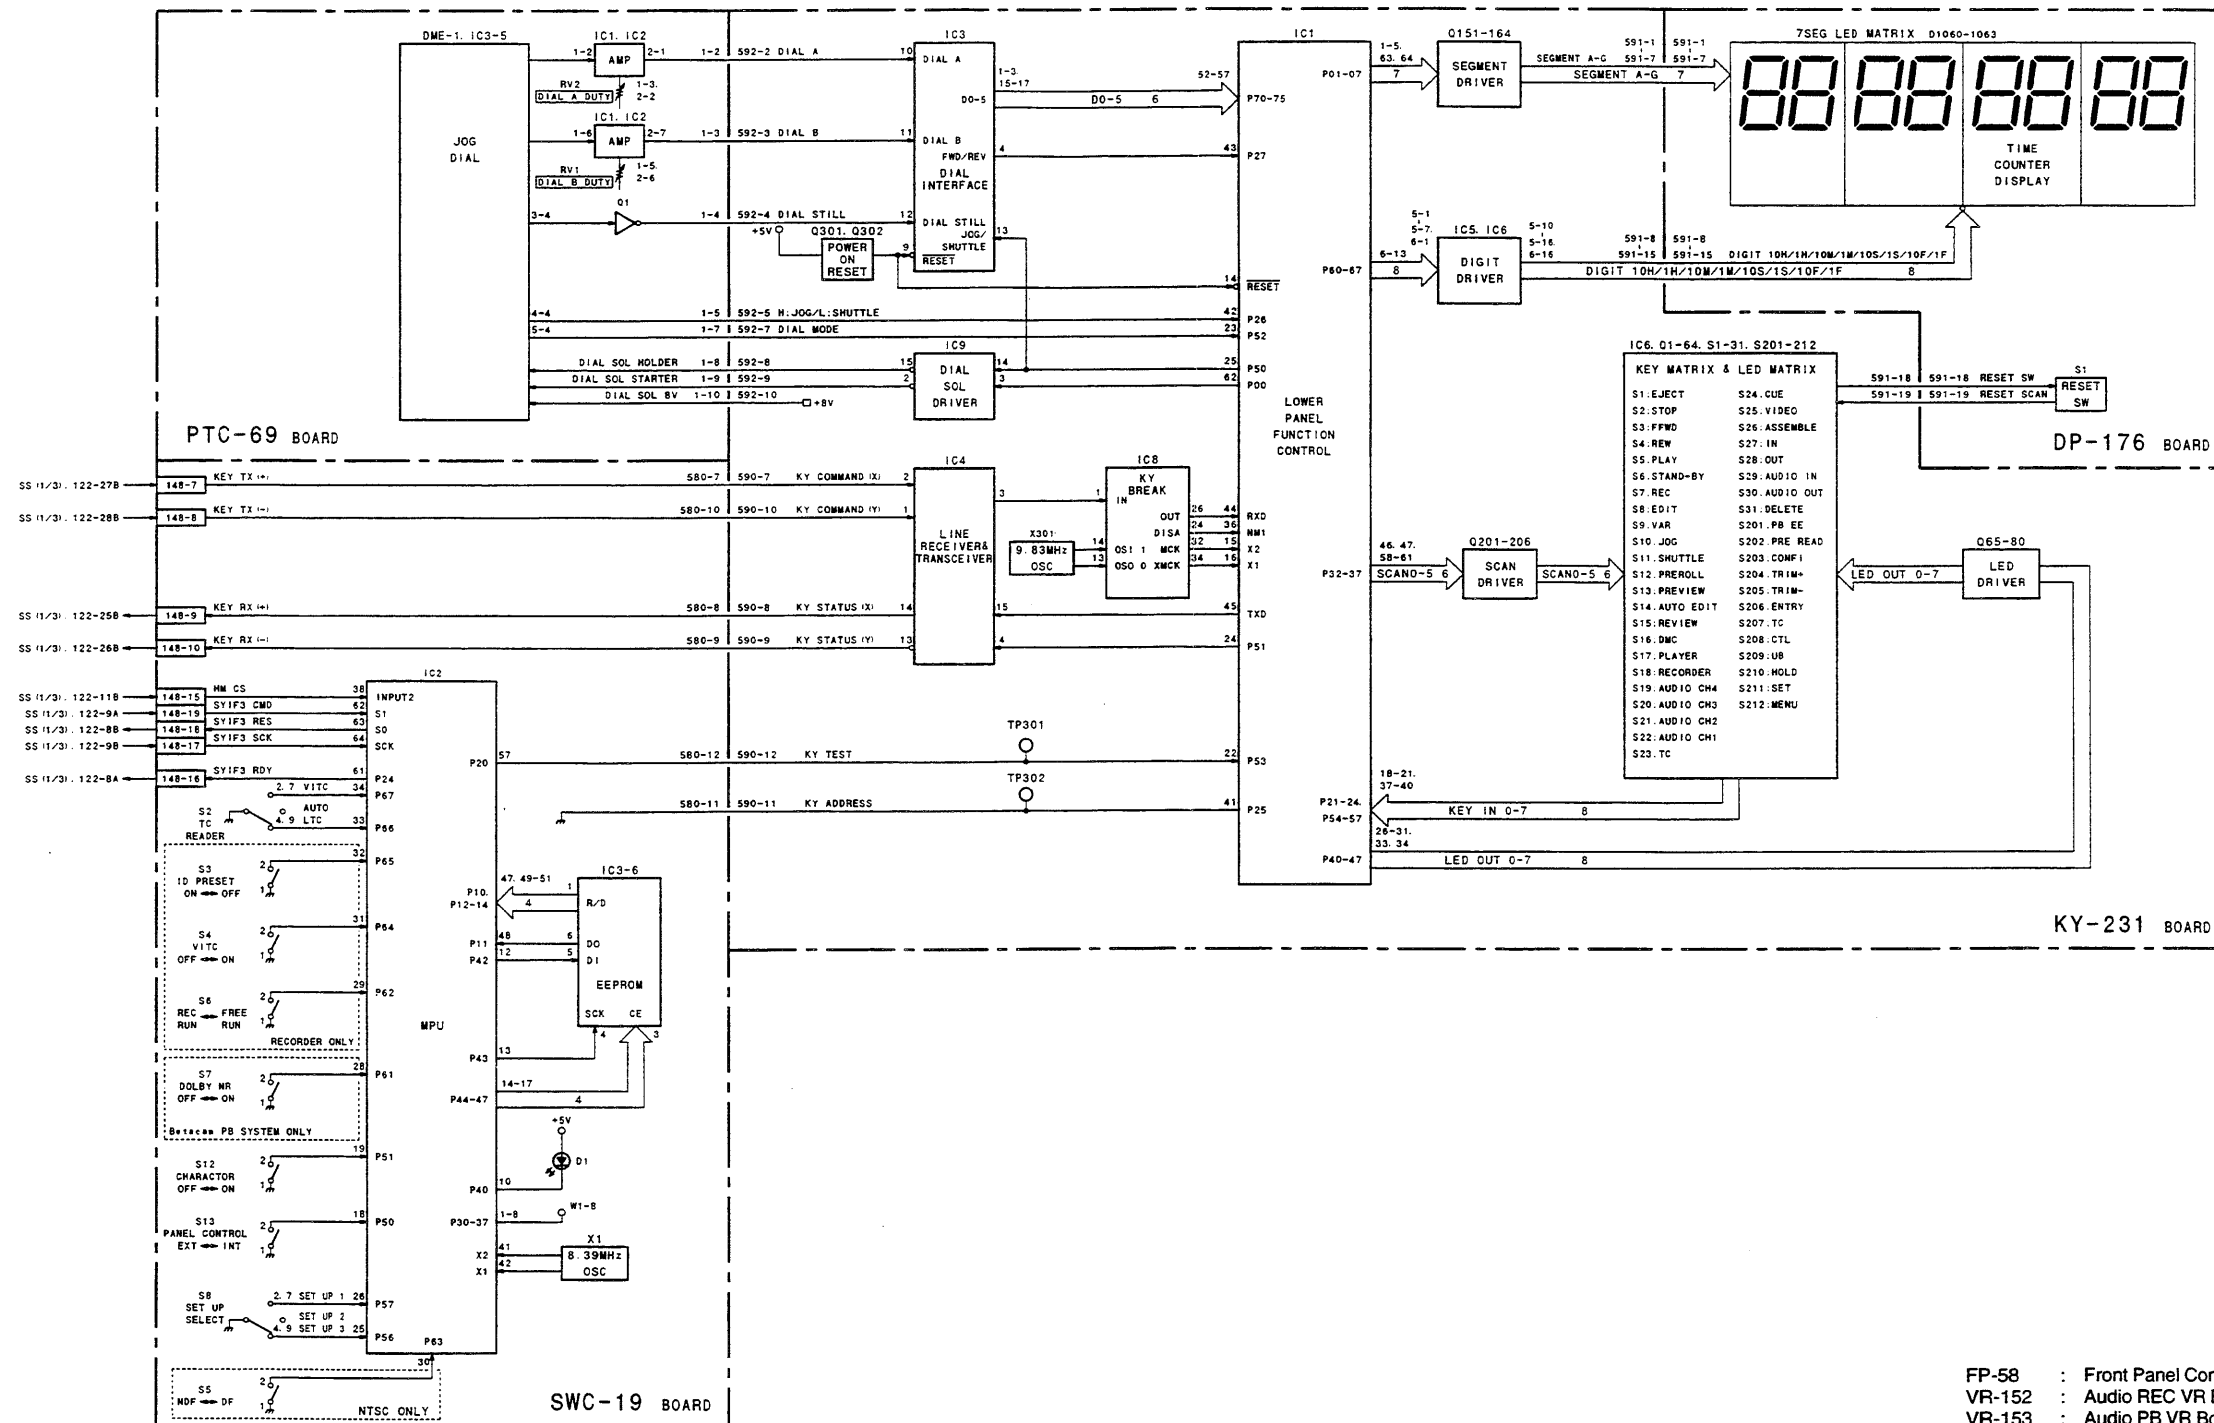

The switching converter controlled by the “LOADING PWM” pulse from SS-52 board is used in the driver power source for the loading motor, so can also control the rotation torque of the loading motor.

[CIRCUIT DESCRIPTION OF DEC-65 BOARD]

DEC-65 board is an analog composite decoder board that separates the input analog composite video signal into digital Y/C data, converts the signal in the 10-bit parallel video data in which Y, R-Y, B-Y data are multiplexed, and sends it to VPR-1 board.

DEC-65 board is optional and is not provided as a standard feature at the factory.

[BKDW-505] (For NTSC format)

[BKDW-506] (For PAL format)

The circuit on DEC-65 board is designed so that it can be also used for a digital composite input (D2 input) signal. However, it cannot be used for the digital composite input signal as equipment. Therefore, only case for an analog composite input signal is described below.

The process outline is first described.

An analog composite input signal is A/D-converted into digital composite data and sent to a main composite decoder (IC606). IC606 separates the composite data from Y data to chroma data, decodes the chroma data into R-Y and B-Y data, and converts the reference clock from 4Fsc to 13.5 MHz in a rate. IC606 then multiplexes Y, R-Y, and B-Y data and outputs it as 10-bit parallel video data (27-MHz clock based on the D1 format).

The outline of the circuit is described next.

The input analog composite video signal enters through a 6-MHz low-pass filter to IC202. IC202 has clamping and VCA functions. The clamp level is corrected by the clamp error voltage from pin 6 of IC606 that is fed back to pin 6 of IC202. The gain is controlled by the DC voltage applied at pin 2 of IC202.

The input level is controlled by this function. The DC voltage applied at pin 2 of IC202 is selected by switch IC307. The selection is performed using an "MA" signal (H: MANUAL, L: AGC) from pin 3 of IC606. When an AGC is on (IC307 selects pin1), the video level is kept constant by feeding back the sync level data from a sync separator circuit on the basis of the level setting data that is supplied from VPR-1 board via an EVR (IC301)(sync AGC).

When an AGC is off (IC307 selects pin2), the gain of IC202 is controlled by the DC voltage D/A-converted from the "GAIN DATA" using IC305. The "GAIN DATA" (GD 0 to GD 7) is obtained when the "MODE DATA" from VPR-1 board is converted from serial to parallel in IC606, and output from IC606.

The video signal that has been adjusted in level, clamped, and output by IC202 branches into two paths. One is sent through a switch (IC203) to the A/D converter (IC601). The another is sent through a buffer (Q201) to the sync separator circuit.

The switch (IC203) is usually connected to pin 1 so that the video signal passes. When a sync signal is input, IC203 is switched to pin 3 by the control signal generated from a sync separator signal, fetching the wide sync signal generated from a signal that branches via a buffer (IC308).

The reason is that the sync width must be expanded from 2 usec to 4 usec according to the specifications of IC606.

The analog composite video signal whose sync width has been expanded is sent to an A/D converter (IC604) and converted into 10-bit parallel data. The A/D conversion is

performed with the 8Fsc frequency generated by a VCO (CP501) as a clock.

The converted data is sent through a digital filter (IC604) and pedestal switcher (IC605) to IC606 (composite decoder) and separated from Y data to chroma data.

In IC606, the phase of the burst signal detected from this data is compared with the phase of the VCO output signal sent to pin 151 as a "CK" pulse, and the phase error voltage is output from pin 16. The Fsc frequency locked to an input signal is obtained when this error voltage is fed back to the VCO.

To suppress that the pedestal level fluctuates by one LSB when it is sampled by IC606 in the later stage, the pedestal switcher integrates the pedestal level and replaces it by the level averaged for every field.

The composite video data that has been input to IC606 (composite decoder) is separated from digital Y data to chroma data.

The chroma data is then decoded into R-Y and B-Y data.

After that, the reference clock is converted from 4Fsc to 13.5 MHz in a rate, and the Y, R-Y, and B-Y data are multiplexed and sent to VPR-1 board as 10-bit parallel video data based on the D1 format. In IC606, the detection of the color frame information from the input signal and the generation of the timing pulses (HD and VD) are also performed. The resultant data and pulses are sent to VPR-1 board.

The Y data is converted from the D2 level setting to the D1 level setting.

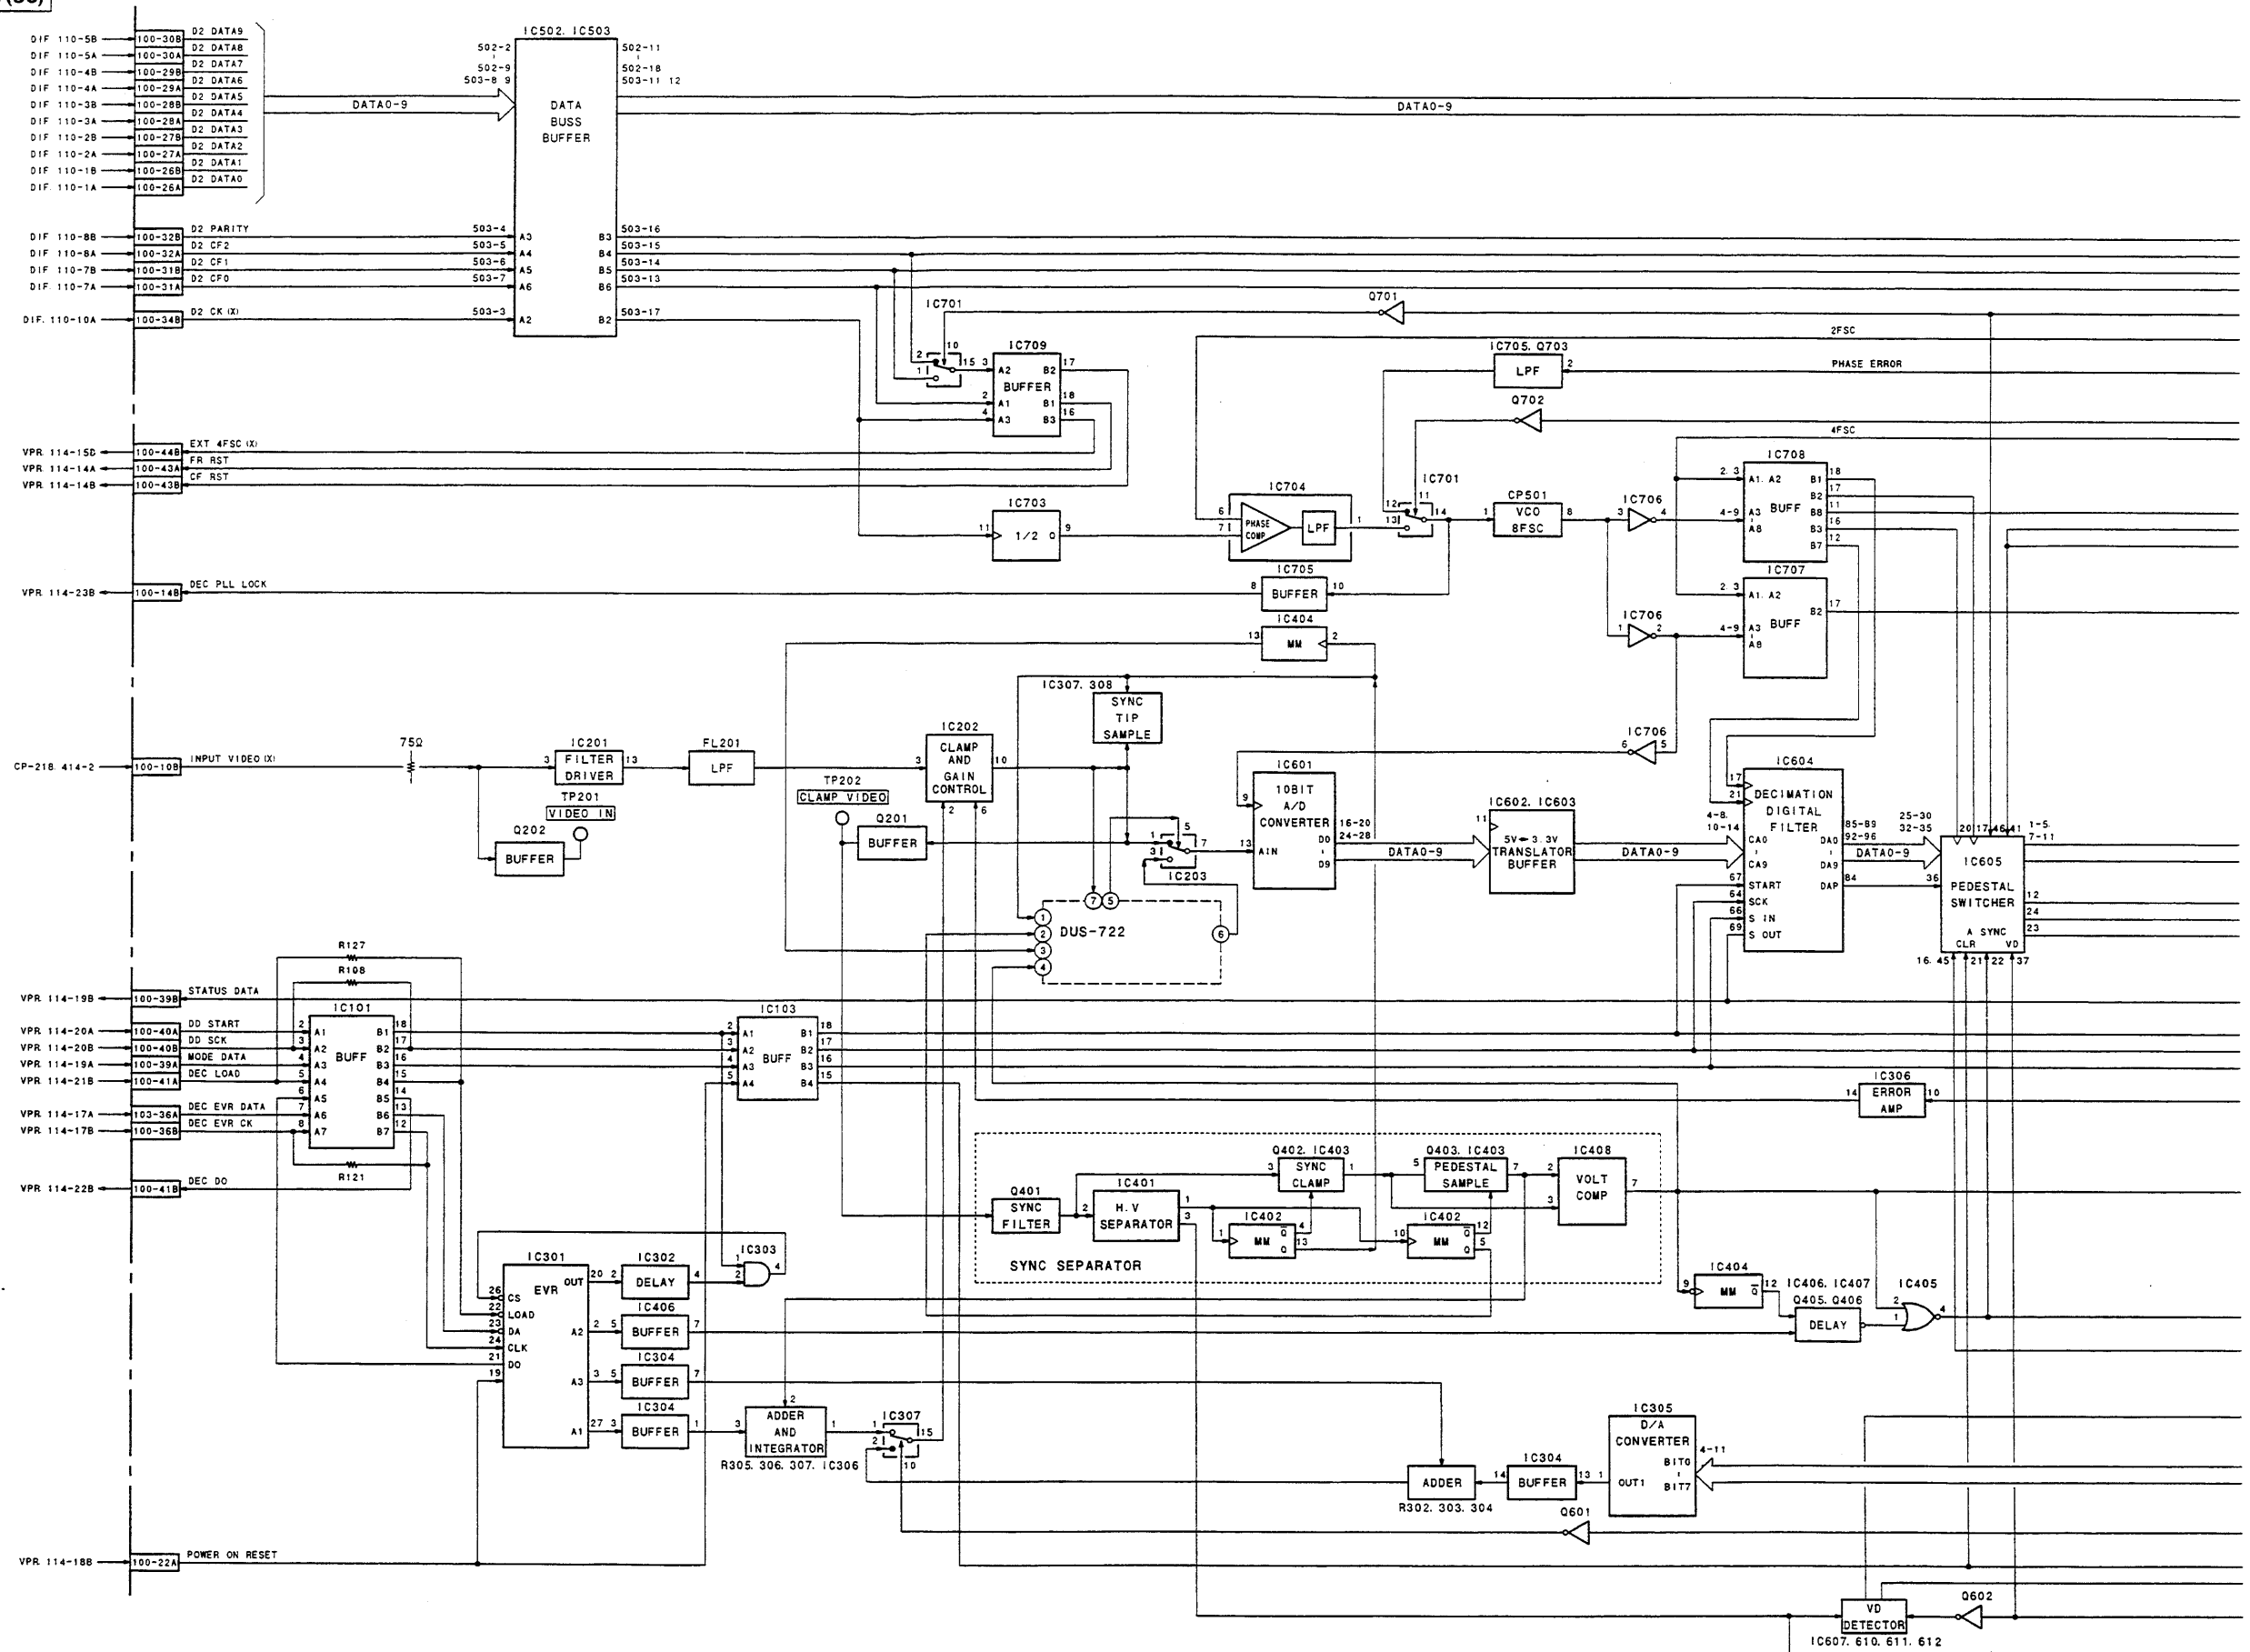

IC606 can be also used for the input signal of a nonstandard signal that is not passed through a TBC circuit.

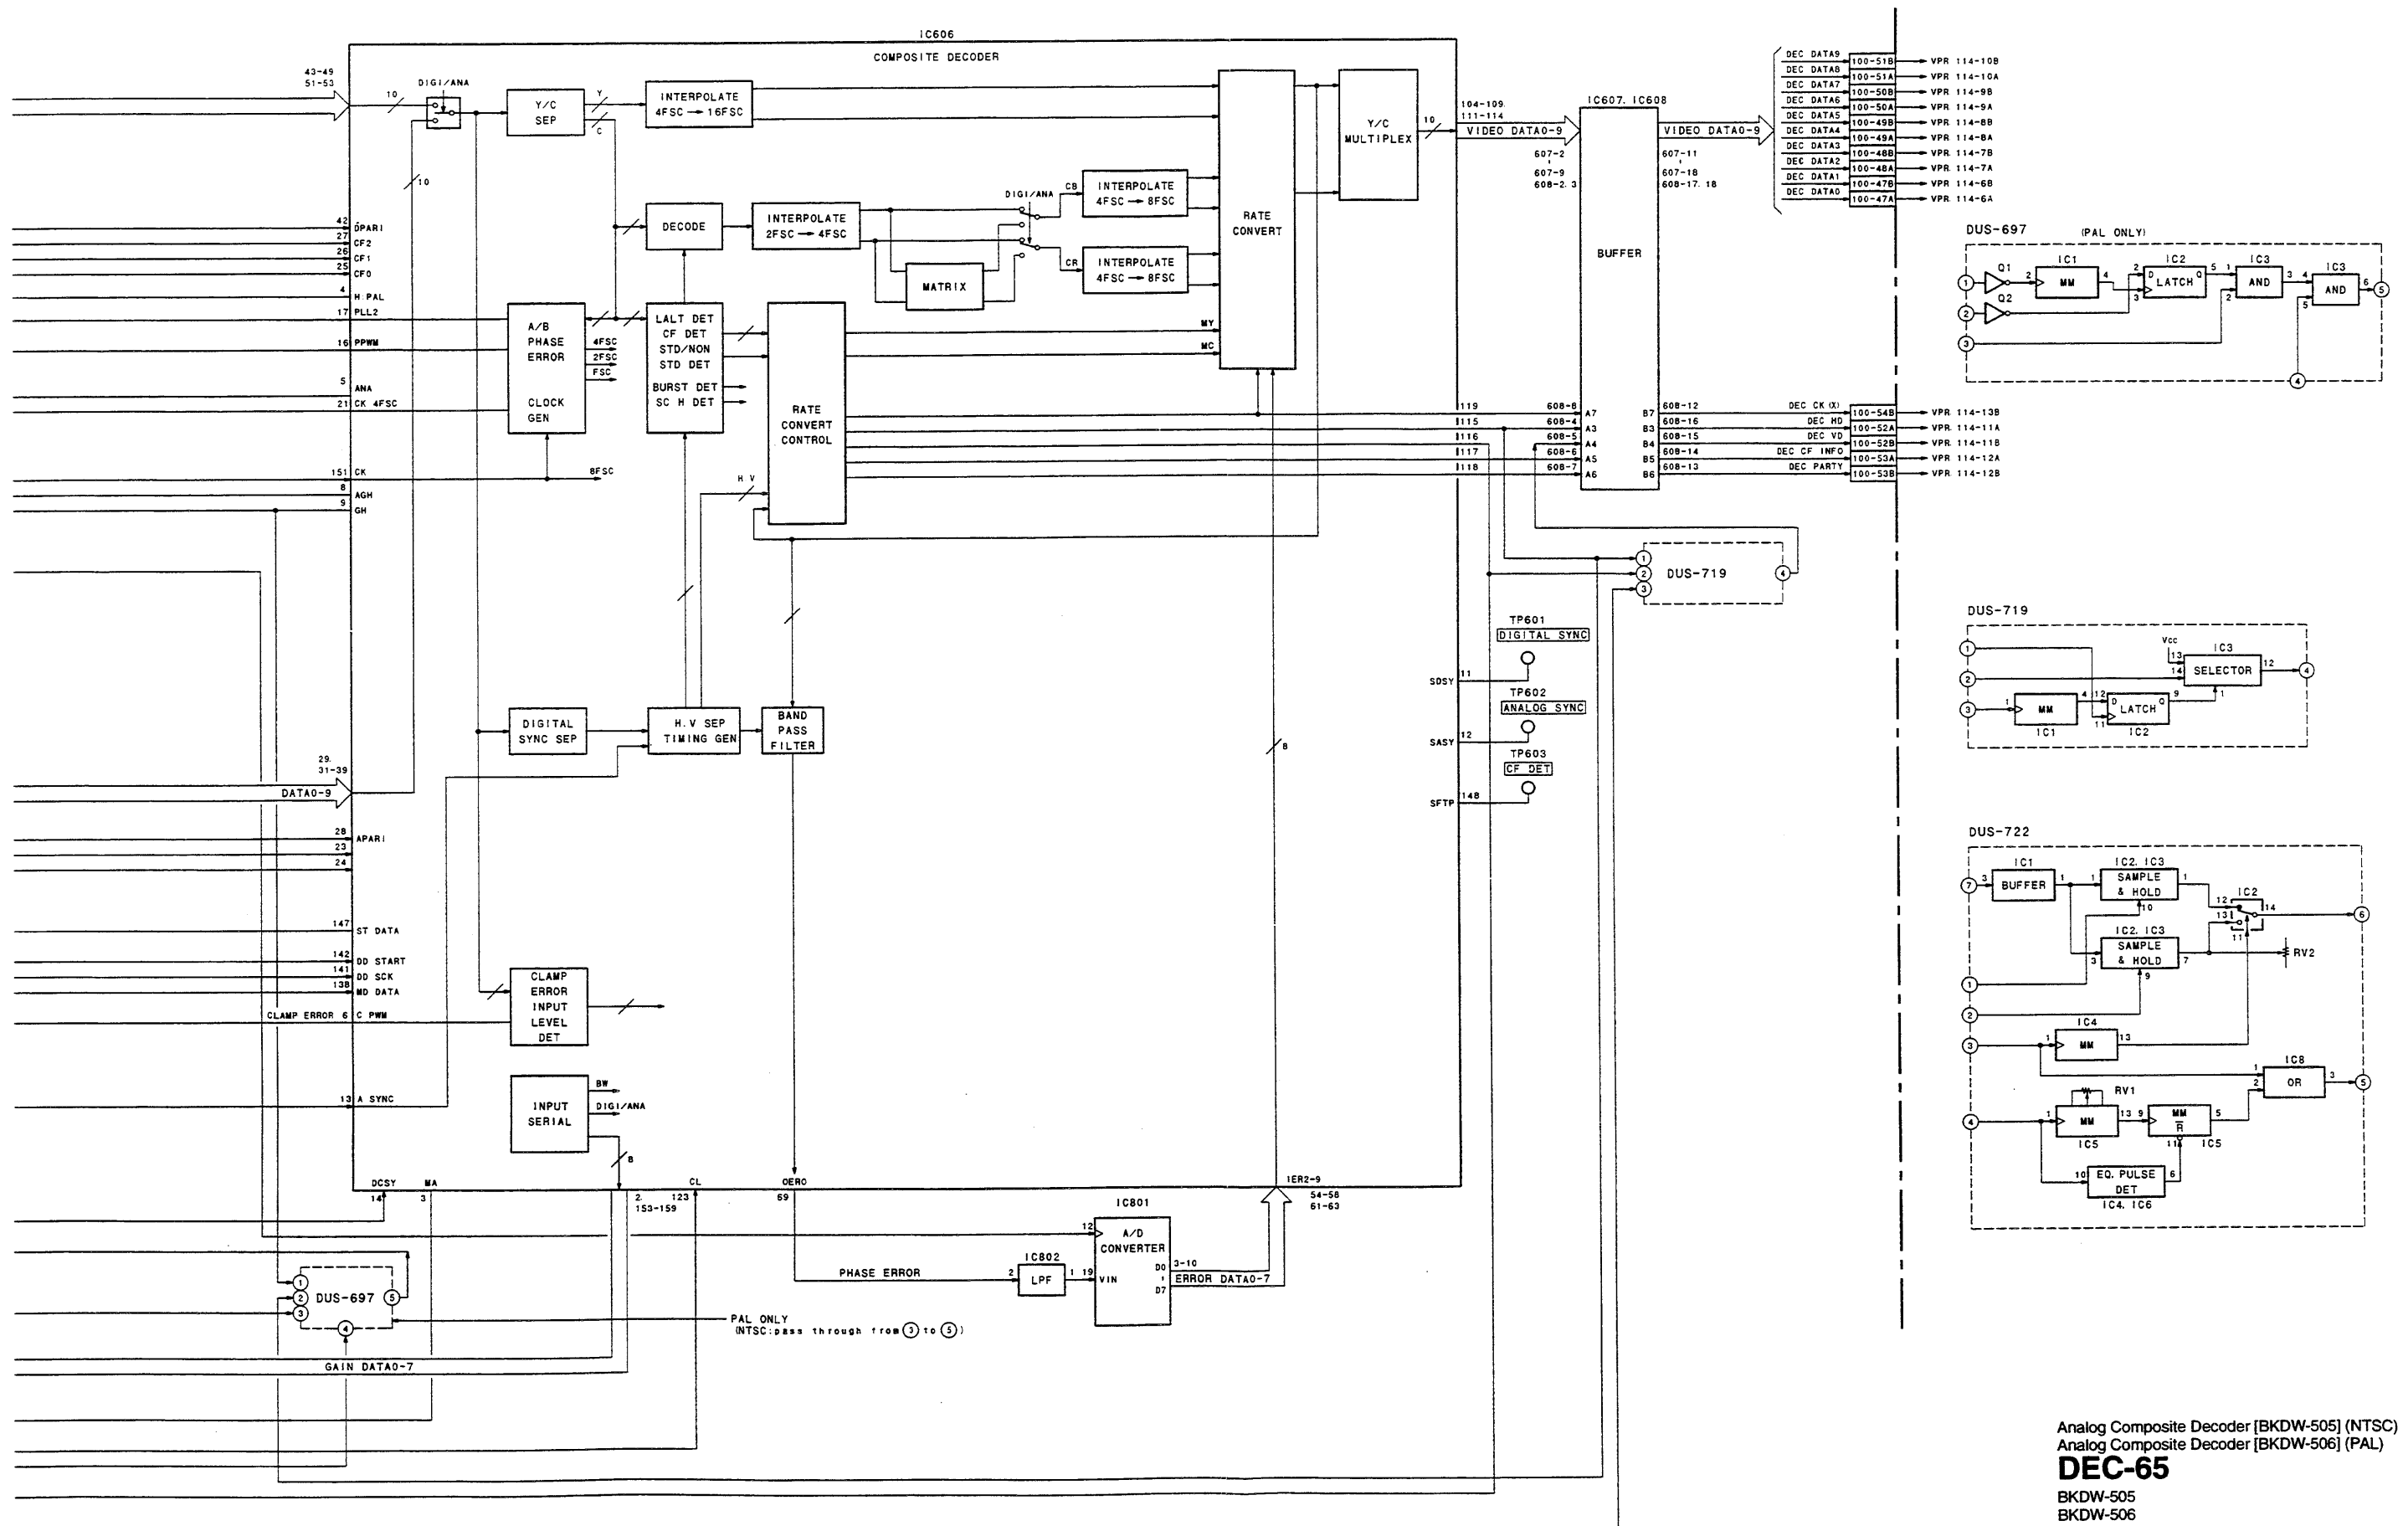

In this case, the phase of an H signal to be expected by calculation is compared with the phase of an H signal obtained from the actual Y signal after rate conversion.

The resultant phase error voltage is output from pin 69 of IC606.

This error voltage is converted into digital error data ("IER 2 to IER 9) using an external A/D converter (IC801) and fed back to IC606 again. The error data fed back to IC606 changes the time-base coefficient in a rate converter and corrects the calculation value. As the result, the jitters in the Y, R-Y, and B-Y signals are absorbed.

ERROR MESSAGES AND TROUBLESHOOTING

4-1. ERROR MESSAGE

This unit features self-diagnostics.

When trouble is detected, an error code is displayed immediately in the time counter display on the lower control panel, an error code and message are superimposed on the video monitor connected to the VIDEO OUTPUT COMPOSITE 3 connector and the SERIAL V/A OUTPUT 4 connector.

Furthermore, as for the interface error (error code 92, 93, 96 and 98), interface object which error occurred replaced by sub error message on the video monitor.

(To display error code and message on the video monitor, the CHARACTER switch on the system setup panel must be set to ON.)

Code	Error message	Description	Detection
01	REEL TROUBLE-1	The slack of the tape is detected during threading or unthreading, and then tape protection is done.	Detected when the ratio of the FG frequency at a supply reel, take-up reel and threading motor is less than the specified value.
02	REEL TROUBLE-2	The slack or breaking of the tape is detected in search, fast forward, or rewind mode, and then tape protection is done.	Detected when the ratio of the FG frequency at a supply reel and take-up reel is less than the specified value.
03	REEL TROUBLE-3	The slack or breaking of the tape is detected in playback mode, or either of the lock of the supply or take-up reel is detected, and then tape protection is done.	Detected when the FG frequency at a supply or take-up reel is zero (0), or when the tension detected from a tension sensor is less than 15 g.
04	REEL TROUBLE-4	It is detected that the tape does not run at the speed of designation in fast forward or rewind mode, and then tape protection is done.	Depends on the comparison between the tape speed using the FG frequency at supply and take-up reels and the designated speed.
05	REEL TROUBLE-5	It is detected that the supply or take-up reel cannot stop with a cassette is not inserted, or detected that over current has been flowing to supply and take-up reels.	Detected using the FG frequency or current at supply and/or take-up reels.
06	TAPE TENSION ERROR	When excessive tension is detected, tape protection is done.	Detected when the tension detected from a tension sensor is more than 55 g.
07	CAPSTAN TROUBLE	It is detected that the tape does not run at the speed of designation in play or search mode, and tape protection is done.	Detected at the tape speed detected from the FG frequency at a capstan motor.
08	DRUM TROUBLE	It is detected that drum motor rotation is not normal, and then tape protection is done.	Detected when the drum speed obtained from the speed FG of the drum motor is less than the specified value.
09	TH/UNTH MOTOR TIME OUT	It is detected that threading or unthreading is not completed, and then tape protection is done.	Detected when threading or unthreading is not completed within ten seconds after it is started.
0A	THREADING TROUBLE	It is detected that threading cannot be done, and then tape protection is done.	Detected when the tape top sensor is acted during threading after the short FF mode is automatically entered three times.

Code	Error message	Description	Detection
10	HUMID	Condensation is detected.	Detected using a DEW (condensation) sensor.
11	TAPE TOP/END SENSOR TROUBLE	The tape top or end sensor operation is defective.	Detected when the tape top and end are detected at the same time.
12	TAPE TOP SENSOR TROUBLE	The tape top sensor operation is defective.	Detected when the tape top continues for more than seven seconds.
13	TAPE END SENSOR TROUBLE	The tape end sensor operation is defective.	Detected when the tape end continues for more than seven seconds.
14	FAN MOTOR TROUBLE	The operation of the fan motor is defective.	Detected according to the period of a ripple noise at the fan motor terminal.
20	CASSETTE COMPARTMENT MOTOR LOCK	It is detected that cassette up/down operation is not completed, and then tape protection is done.	Detected when cassette up/down operation is not completed within four seconds after it is started.
21	REEL SHIFT MOTOR LOCK	It is detected that driving of the L position to S position or the S position to L position in the reel table is not completed, and then tape protection operation is done.	Detected when reel table driving is not completed within four seconds after it is started.
22	REEL POSITION SENSOR TROUBLE	The operation of the L/S position sensor of the reel table is defective.	Detected when the L and S positions are detected at the same time.
90	KEY BOARD INTERFACE ERROR	The interface between the KY-231 board and SS-52 board is defective.	Detected when no interface signal is sent from the SS-52 board to the KY-231 board.
91	1/2 VD NOT EXIST	No 1/2 VD signal input to SS-52 board is detected.	Detected when no 1/2 VD signal input to the SS-52 board.
92	INTERNAL INTERFACE ERROR sub error message FP APR RM SWC DPR VPR TBC DM	The serial or parallele interface between below board and SS-52 board is defective. (DPR-36 board; parallele interface) FP : IC6 of FP-58 board APR : IC51 of APR-1 board RM : IC2 of RM-130 board (BKDW-509) SWC : IC2 of SWC-19 board DPR : DPR-36 board VPR : IC753 of VPR-1 board TBC : IC202 of TBC-23 board (DVW-A500P/A500 only) DM : IC906 of DM-89 board (DVW-A500P/A500 only)	Detected when no interface signal is sent from the each board to the SS-52 board three times continuously.
93	CPU INITIALIZE ERROR sub error message DT main servo (SV1) drum servo (SV2)	The interface between below CPU on SS-52 board and main CPU (of IC5 on SS-52 board) is defective when the POWER switch is turned ON. DT : IC2104 main servo (SV1) : IC750 drum servo (SV2) : IC700	Detected when no interface signal is sent from the each CPU to the main CPU at the POWER switch is turned ON.
94	CPU INITIALIZE ERROR 2	The operational defect of main CPU (of IC5 on SS-52 board) is defective when the POWER switch is turned ON. (Not display on the video monitor)	Detected when no interface signal is sent from the main CPU to the sub CPU (of IC50 on SS-52 board) at the POWER switch is turned ON.

SECTION 5

MAINTENANCE MODE

5-1. OUTLINE

The DVW-A500P/500P/A500/500 has the maintenance mode required for maintenance and troubleshooting. The maintenance mode is as described below.
Each mode consists of some menus and submenus.
(For the menu tree, refer to page 5-4.)

C0: SERVO/DT CHECK
C1: RF CHECK
C2: AUDIO/VIDEO CHECK
C3: BETACAM PB CHECK (DVW-A500P/A500 only)
C4: OTHERS CHECK
A0: SERVO/DT ADJUST
A1: RF ADJUST
A2: AUDIO/VIDEO ADJUST
A3: BETACAM PB ADJUST (DVW-A500P/A500 only)

The contents of the maintenance mode are superimposed on the video monitor that is connected to the VIDEO OUTPUT COMPOSITE 3 connector and SERIAL V/A OUTPUT 4 connector.

The figure below shows an example of the screen display.

MAINTENANCE MODE		
*C0 :	SERVO/DT	CHECK

Notes on operation of the control panel BKDW-515

When using the maintenance mode from the control panel BKDW-515, please read some words in this section as follows.

SET button → F8 (SELECT) key
MENU button → F10 (EXIT) key
KY → CP

The buttons etc. related to the maintenance mode are as follows:

- ① **Time counter (Lower control panel)**
 The menu number is displayed in the blinking/lighting state during menu assignment.
 For the manual adjustment, data is displayed in the blinking state.
 Be sure to use a video monitor because the information that can be displayed on the time counter is restricted in the maintenance mode.
- ② **MENU button (Lower control panel)**
 In the maintenance mode, the MENU button has the same function as switch ⑨ S301 on the SS board.
- ③ **SET button (Lower control panel)**
 In the maintenance mode, the SET button has the same function as switch ⑧ S300 on the SS board.
 With DIP switch ⑩ S100-7 on the SS board set to ON (upper position), the maintenance mode is entered when this button is pressed while pressing the ④ CTL button in the setup menu mode.
- ④ **CTL button (Lower control panel)**
 With DIP switch ⑩ S100-7 on the SS board set to ON (upper position), the maintenance mode is entered when the ③ SET button is pressed while pressing this button in the setup menu mode.
- ⑤ **SHUTTLE button (Lower control panel)**
 When the ⑦ search dial is turned while pressing this button during manual adjustment, the adjustment data can be changed.
- ⑥ **JOG button (Lower control panel)**
 The JOG lamp lights when this button is pressed once. The ⑦ search dial is then set to the JOG mode.
 When the ⑦ search dial is turned while pressing this button during manual adjustment, the adjustment data can be changed.
- ⑦ **Search dial (Lower control panel)**
 The search dial selects each menu in the JOG mode.
 To change the adjustment data during manual adjustment, turn this search dial while pressing the ⑥ JOG button or ⑤ SHUTTLE button.
 The SHUTTLE and JOG modes are alternately selected every time this dial is pressed. The lamp (SHUTTLE or JOG) indicating the corresponding mode then lights.
- ⑧ **S300 (SS board): DIAG/ADJUST 1 switch (ADJ +)**
 Press this switch to activate the maintenance mode.
 In the maintenance mode, press this switch to execute the menu or submenu selected by the ⑦ search dial.
 In the maintenance mode, the ③ SET button is also the same in function as this switch.
- ⑨ **S301 (SS board): DIAG/ADJUST 2 switch (ADJ -)**
 In the maintenance mode, press this switch to return to the preceding screen.
 To exit the maintenance mode, press this switch when the mode screen is displayed.
 In the maintenance mode, the ② MENU button is also the same in function as this switch.
- ⑩ **S100-7 (SS board): MAINTENANCE MODE ACCESS ENABLE switch**
 To enter the maintenance mode by the button operation on the front panel, set this switch to ON (upper position) in advance.

Lower Control Panel

Switch Position on SS Board

Activating the maintenance mode

- (1) Confirm that the video monitor is connected to the VIDEO OUTPUT COMPOSITE 3 connector or SERIAL V/A OUTPUT 4 connector.
- (2) Press the ⑧ S300 (SS board).
- (3) The mode screen in the maintenance mode is displayed on the monitor screen.

Terminating the maintenance mode

- (1) Press the ② MENU button or ⑨ S301 (SS board) several times to display the mode screen.
- (2) Press the ② MENU button or ⑨ S301 (SS board) again when the mode screen is displayed. The maintenance mode is then exited.

Mode Screen

Activating the maintenance mode on lower control panel

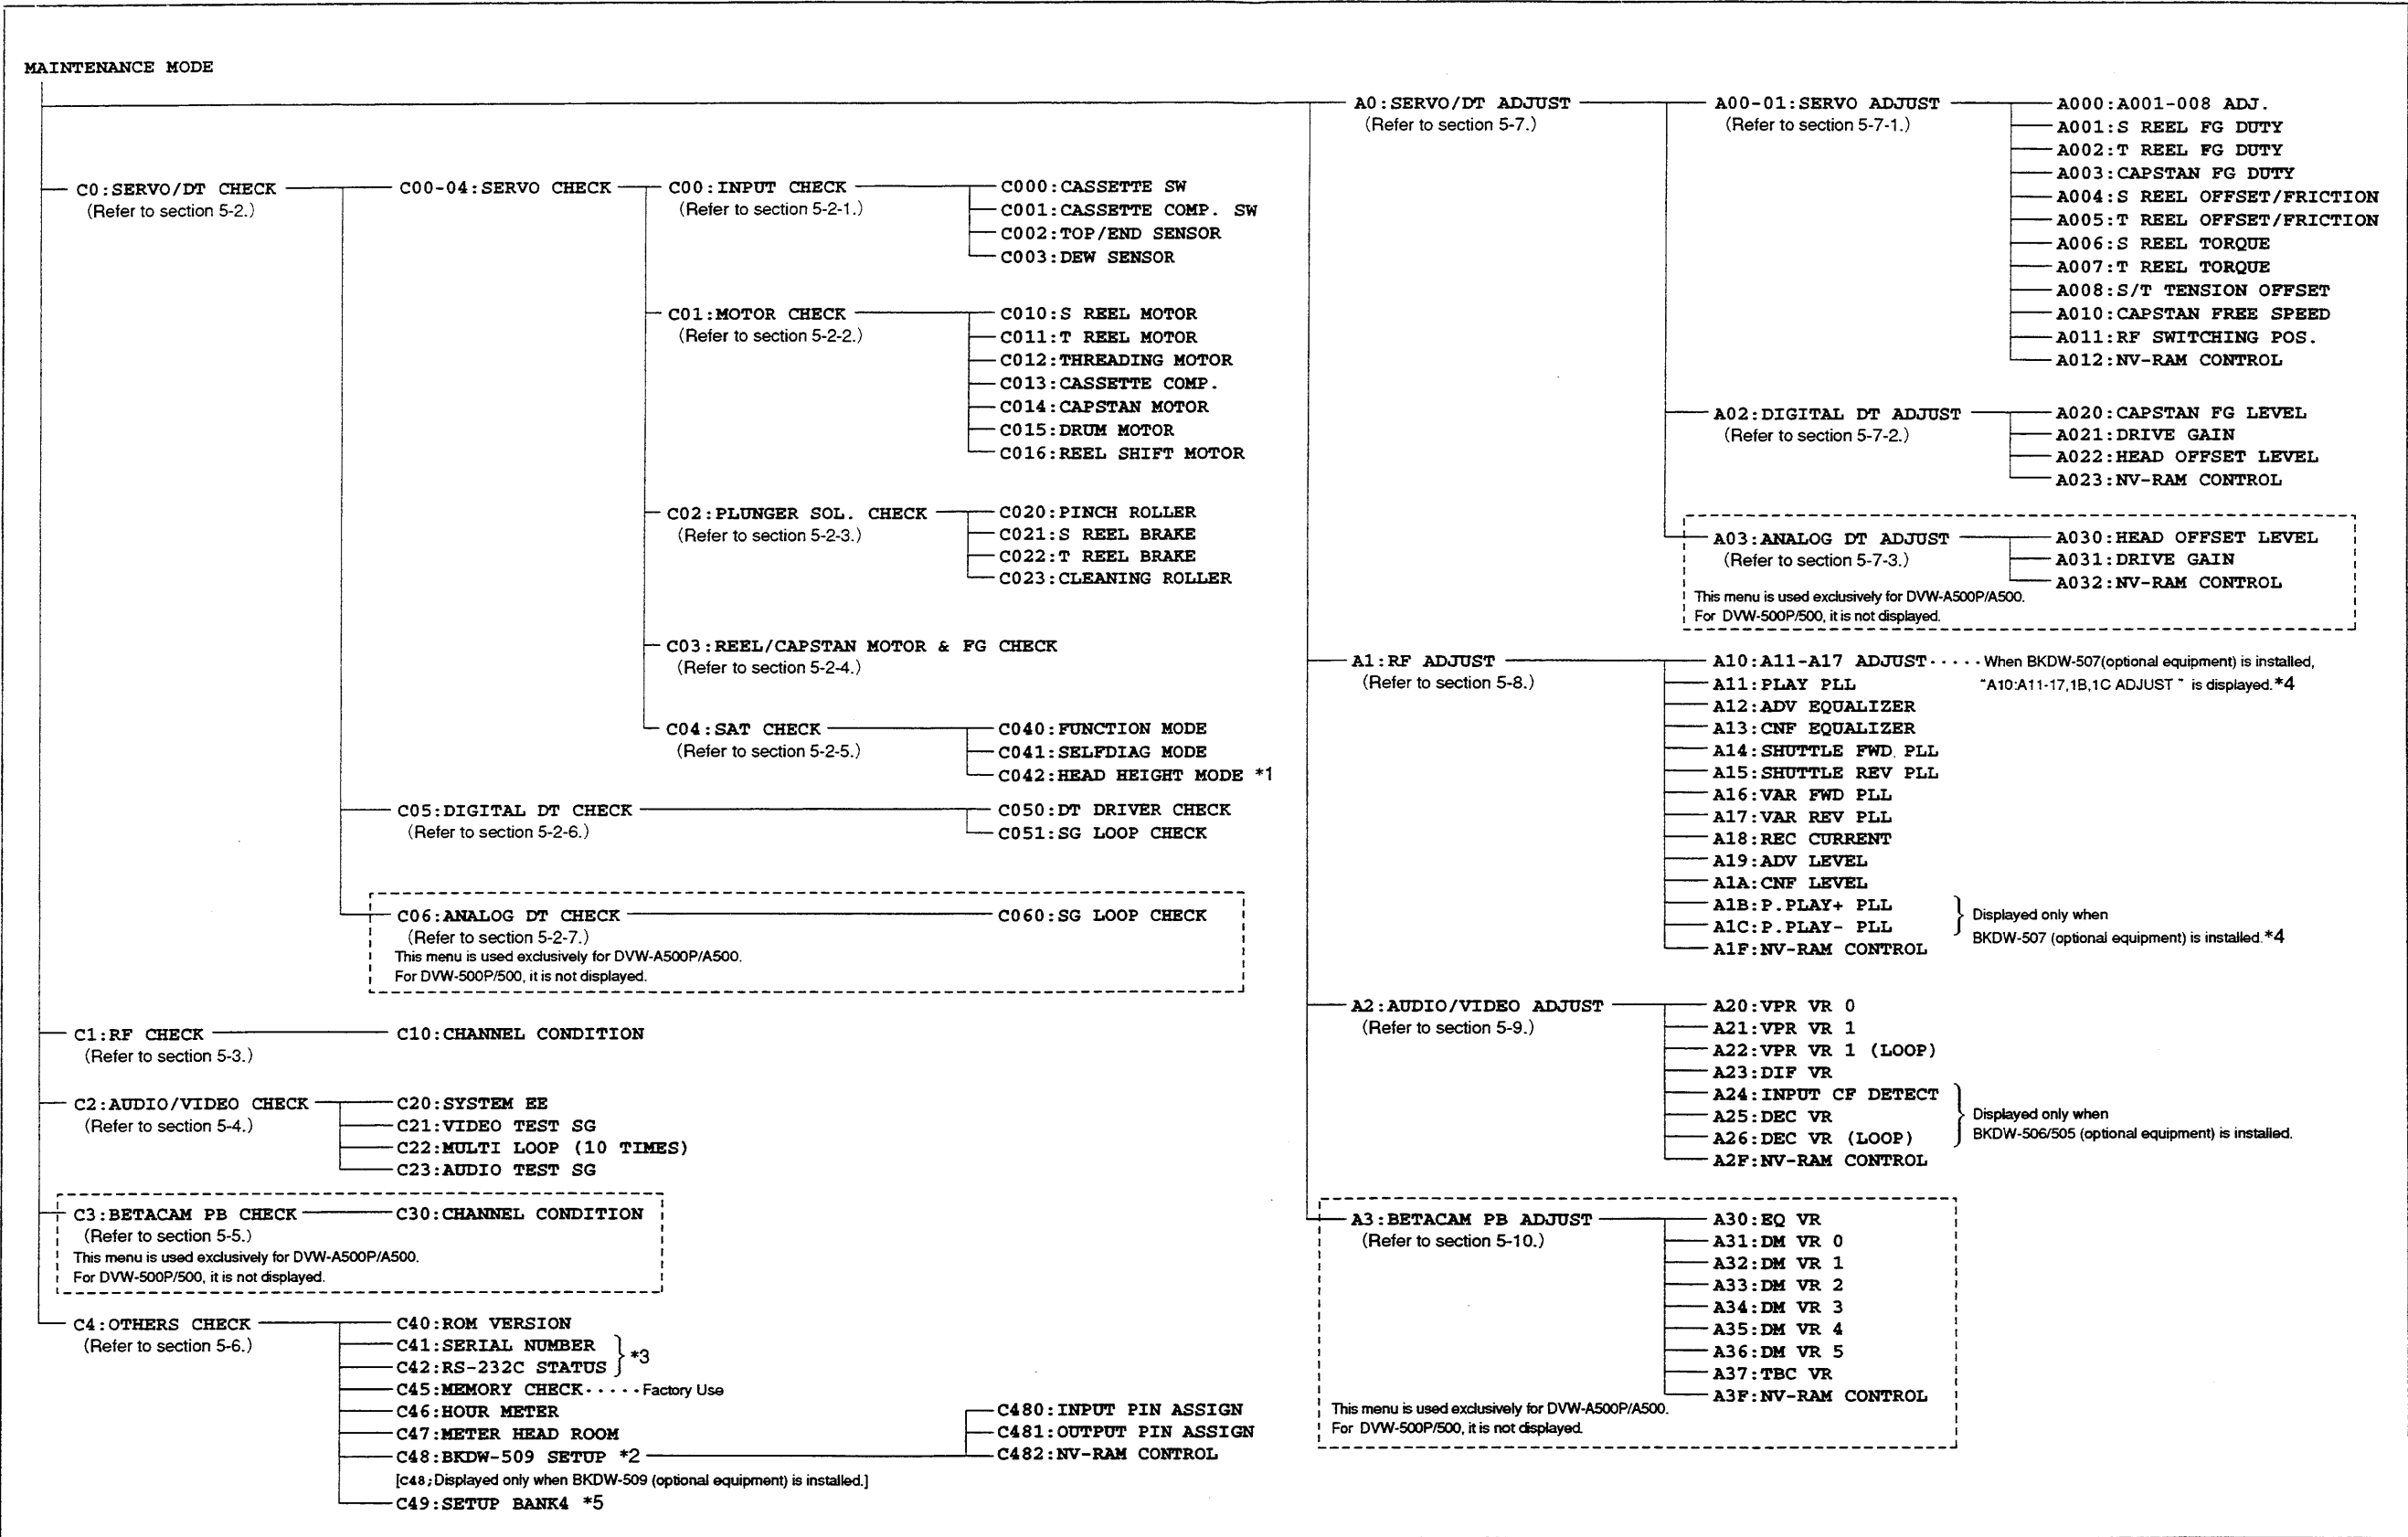

When the ⑩ S100-7 (SS board) is set to ON (upper position), the maintenance mode can be activated by the operation mentioned below.

BKDW-514

- (1) Press the ② MENU button once.
(The mode then changes from operation mode to setup menu mode.)
- (2) Press the ③ SET button while pressing the ④ CTL button.
(The mode then changes from setup menu mode to maintenance mode.)
- (3) The mode screen in the maintenance mode is displayed on the monitor screen.

BKDW-515

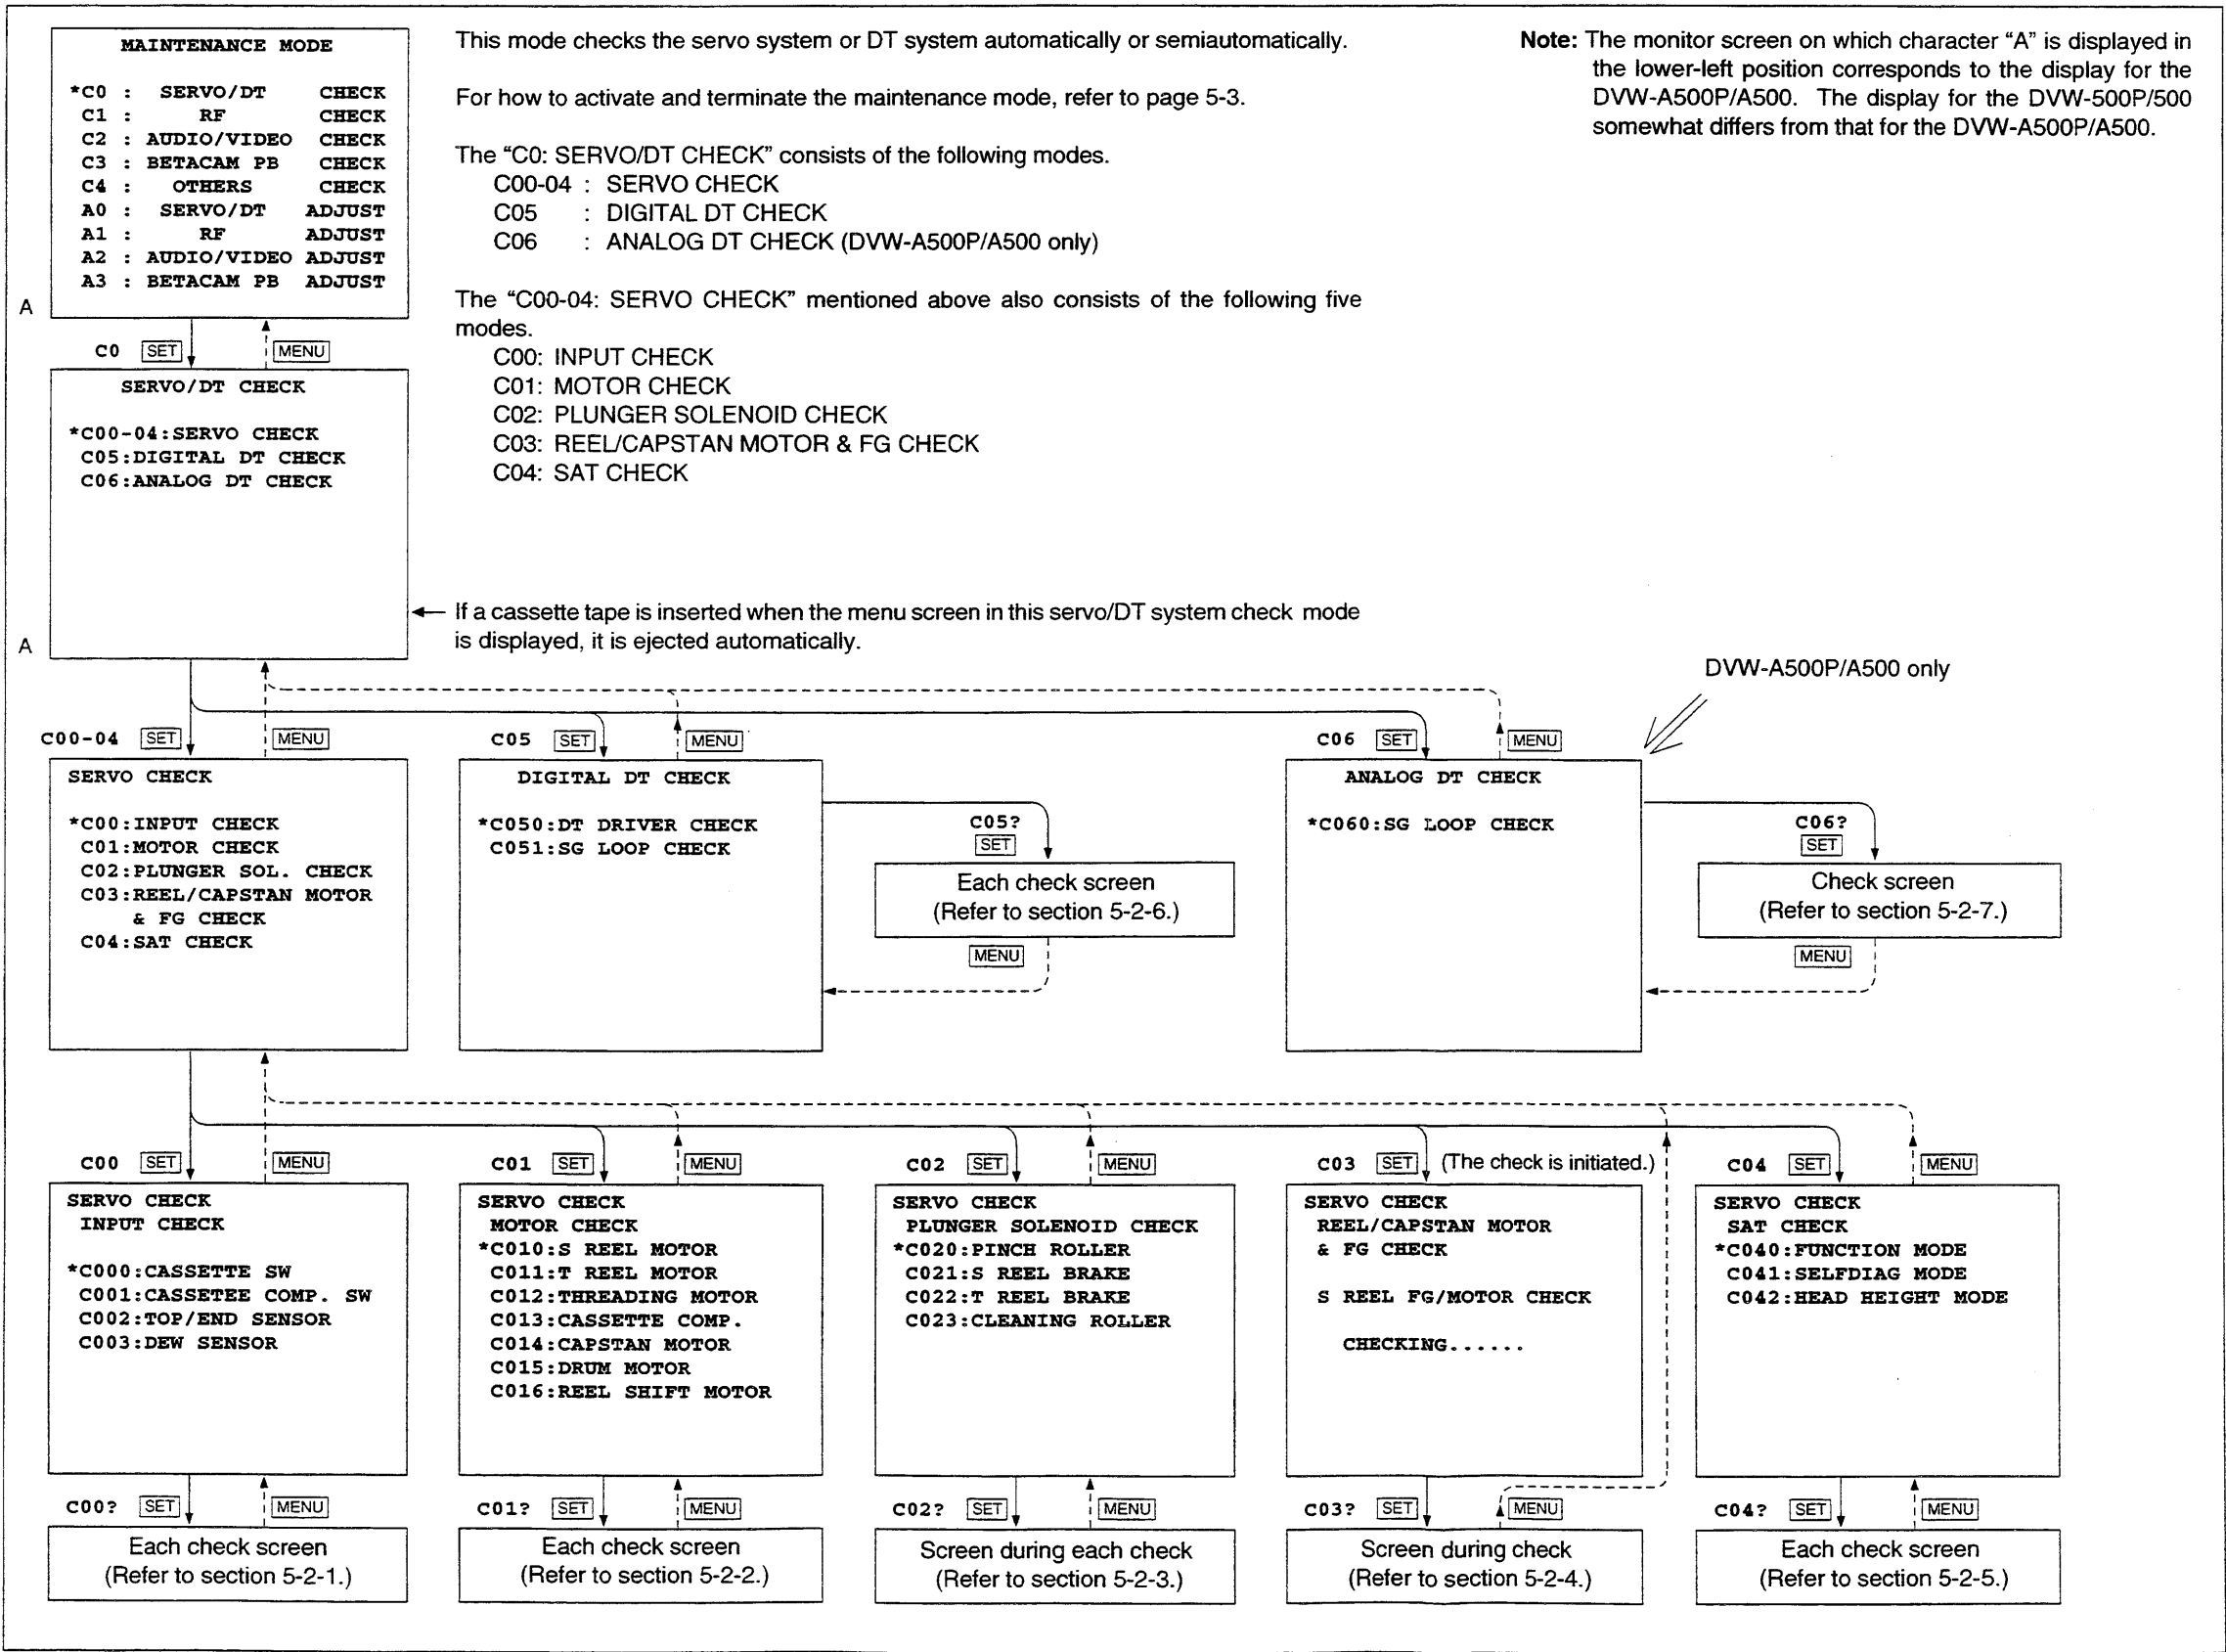

- (1) Press the MAINTENANCE button while pressing the SFT key.
(The mode then changes from operation mode to maintenance mode for the control panel.)
- (2) Press the F6 (VTR MAINT) key.
(The mode then changes to VTR maintenance menu.)
- (3) The mode screen in the maintenance mode is displayed on the monitor screen.

*1: This mode is applied to the unit in which the SV1 ROM (IC761 on the SS board) version is 1.20 or higher.
*2: This mode is applied to the unit in which the version numbers of both SYS1 ROM (IC12) and SYS2 ROM (IC54) on the SS board are 1.10 or higher.
*3: These modes are applied to the unit in which the three version numbers of SYS1 ROM (IC12), SV1 ROM (IC761), and DT ROM (IC211/IC2110) on the SS board are 2.00 or higher.
*4: The A1B and A1C modes are applied on the unit in which the two version numbers of SYS1 ROM (IC12) and SV1 ROM (IC761) are 2.10 or higher.
*5: This mode is applied to the unit in which the version numbers of both SYS1 ROM (IC12) and SYS2 ROM (IC54) on the SS board are 3.10 or higher.

Menu Tree

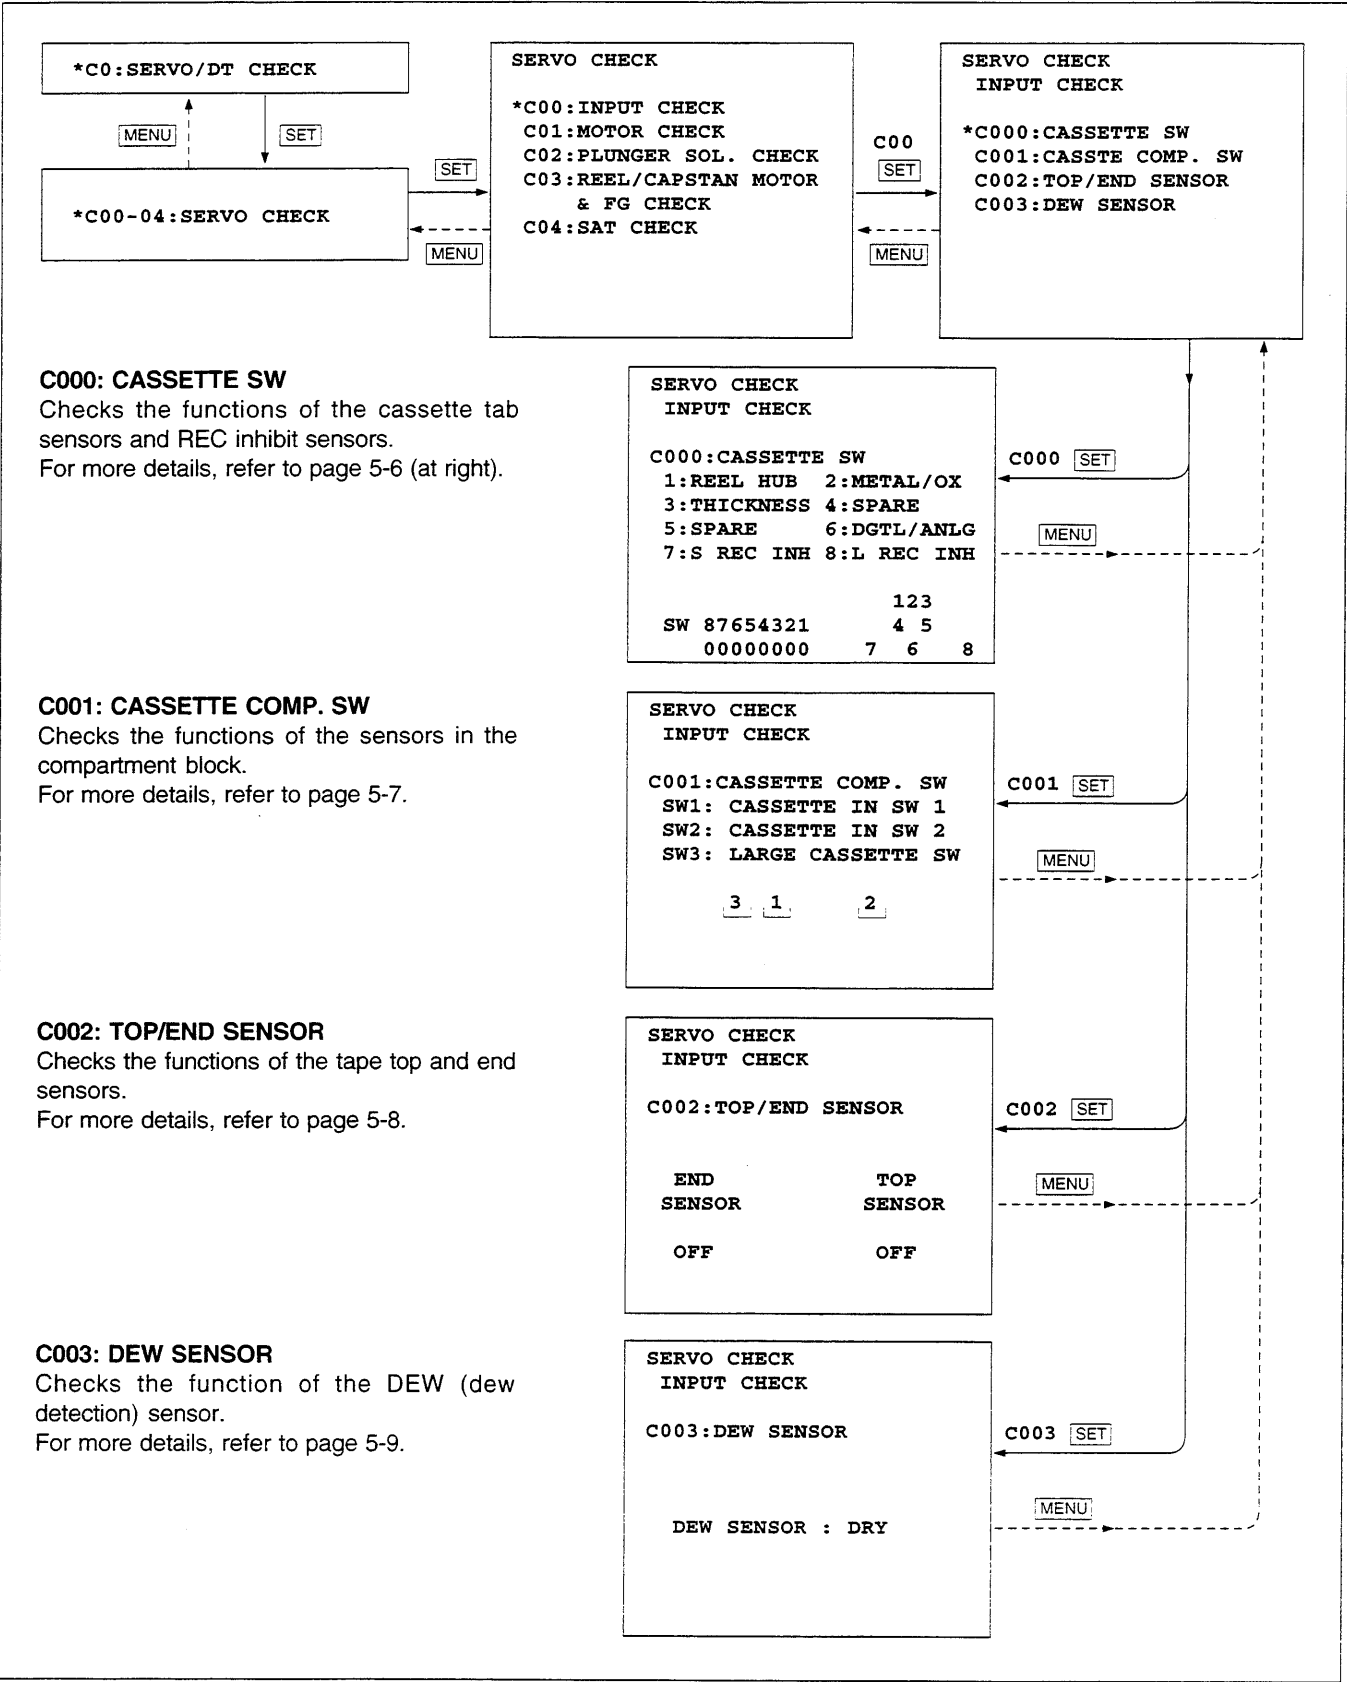

5-2. SERVO/DT SYSTEM CHECK MODE (C0: SERVO/DT CHECK)

"C042 : HEAD HEIGHT MODE" is applied to unit in which the SV1 ROM (IC 761 on the SS board) version is 1.20 or higher.

5-2-1. Servo System Check 1 (C00: INPUT CHECK)

This section describes the “C00: INPUT CHECK” mode.

a) C000: CASSETTE SW

This mode checks the functions of the cassette tab sensors and REC inhibit sensors (switches).

Confirm that lowest digit “0” of the corresponding switch number on the monitor screen changes to “1” when switches/sensors ① through ⑧ in the figure below are pressed manually. Also confirm that the lowest digit returns from “1” to “0” when they are released.

In case of NG;

When “1” is not displayed in the specified position or when the display does not return from “1” to “0”.

The cassette tab sensors (① through ⑥) are NG.

Check the corresponding sensors on the PTC-59 board.

Also check the sensor input circuit on the DR-307/200 board.

The REC inhibit sensors (⑦ and ⑧) are NG.

Check the corresponding sensors on the HN-181 board.

Also check the sensor input circuit on the DR-307/200 board.

SERVO CHECK INPUT CHECK

00000000								7 6 8	

b) C001: CASSETTE COMP. SW

This mode checks the functions of the sensors (switches) in the compartment block.

Confirm that the corresponding switch number on the monitor screen changes to "■" when switches SW1 through SW3 in the figure below are pressed manually. Also confirm that "■" changes to the corresponding number when they are released.

In case of NG;

When "■" is not displayed in the specified position or when the display does not return from "■" to the corresponding number.

Check the corresponding sensors on the PC-70 board.

Also check the sensor input circuit on the DR-307/200 board.

c) C002: TOP/END SENSOR

This mode checks the function of the tape top and end sensors.

Confirm that the "OFF" display on the monitor screen changes to "ON !" when a screwdriver is brought near sensors ① and ② in the figure below. Also confirm that the display changes from "ON !" to "OFF" when the screwdriver is released from the sensors.

In case of NG;

When "ON !" is not displayed in the specified position or when the display does not return from "ON !" to "OFF" .

Check only the sensors.

Also check the sensor input circuit on the DR-307/200 board.

SERVO CHECK INPUT CHECK	
C002:TOP/END SENSOR	
END SENSOR	TOP SENSOR
OFF	OFF

d) C003: DEW SENSOR

This mode checks the function of the DEW (dew detection) sensor.

- (1) Confirm that the “DRY” display on the monitor screen changes to “WET !” when the sensor is slightly touched with a cotton swab moistened with water.
- (2) Wipe the sensor with a dry cotton swab to eliminate water. Confirm that the display on the monitor screen returns from “WET !” to “DRY” when a wind is blown against the sensor using a blower to evaporate moisture.

In case of NG;

When the display does not change from “DRY” to “WET !” even if the sensor is moistened.

Check only the sensor.

5-2-2. Servo System Check 2 (C01: MOTOR CHECK)

This section describes the “C01: MOTOR CHECK” mode.

a) C010: S REEL MOTOR

This mode checks the rotation of the S reel motor.

Turn the S reel motor using a search dial (JOG mode).

Dial	Rotation direction of the S reel motor
FWD	FORWARD ()
REV	REVERSE ()

Confirm that the S reel motor rotates in the direction specified by the dial after the S brake solenoid is turned on and after the S reel brake is released.

In case of NG;

When the ON operation sound of the S brake solenoid is not generated or when the S reel motor does not rotate in the direction specified by the dial.

Check the S reel motor driver circuit (DR-307/200 board).

SERVO CHECK
MOTOR CHECK

b) C011: T REEL MOTOR

This mode checks the rotation of the T reel motor.

Turn the T reel motor using a search dial (JOG mode).

Dial	Rotation direction of the T reel motor
FWD	FORWARD ()
REV	REVERSE ()

Confirm that the T reel motor rotates in the direction specified by the dial after the T brake solenoid is turned on and after the T reel brake is released.

In case of NG;

When the ON operation sound of the T brake solenoid is not generated or when the T reel motor does not rotate in the direction specified by the dial.

Check the T reel motor driver circuit (DR-307/200 board).

SERVO CHECK
MOTOR CHECK
C011:T REEL MOTOR

TURN JOG DIAL
IN JOG MODE

S301(SS-52): RETURN

c) C012: THREADING MOTOR

This mode checks the rotation of the threading motor, and the functions of the thread end sensor and unthread end sensor.

Turn the threading motor using a search dial (JOG mode). As a result, the thread ring moves as shown in the table below.

Dial	Movement of the threading ring
FWD	Threading
REV	Unthreading

Confirm that the display on the monitor screen changes as shown below.

TURN JOG DIAL
IN JOG MODE
FWD:THREAD, REV:UNTH

S301(SS-52): RETURN
  
```

In case of NG;

When the threading motor does not rotate.

Check the threading motor and the FG sensor on the PTC-54 board.

Also check the threading motor driver circuit (DR-307/200 board) and the threading FG amplifier circuit (DR-307/200 board).

When the display remains "....." with the unit set to the thread end/unthread end state.

Check the thread end sensor and unthread end sensor on the TR-79 board.

d) C013: CASSETTE COMP.

This mode checks the operation of the cassette compartment motor, and the function of the cassette down sensor.

- (1) Press the SET button (or switch S300 on the SS board).

Confirm that the compartment block goes down. At that time, confirm that the display on the monitor screen changes as shown below.

UP → HORIZ. → VERT. → DOWN

- (2) Press the SET button (or switch S300 on the SS board) again.

Confirm that the compartment block goes up. At that time, confirm that the display on the monitor screen changes as shown below.

DOWN → VERT. → HORIZ. → UP

SERVO CHECK
MOTOR CHECK

UP

S300(SS-52): CHECK
S301(SS-52): RETURN

In case of NG;

When the cassette compartment motor does not rotate.

Check the cassette compartment motor.

Also check the cassette compartment motor driver circuit (DR-307/200 board).

When the compartment block goes up and down normally, but the display does not change.

Check the cassette down sensor.

Also check the sensor input circuit on the DR-307/200 board.

Top View of the Cassette Compartment

e) C014: CAPSTAN MOTOR

This mode checks the rotation direction of the capstan motor.

- (1) Press the SET button (or switch S300 on the SS board).
Confirm that the capstan motor rotates in the forward direction () and that the "FORWARD OK" display appears on the monitor screen.
- (2) Press the SET button (or switch S300 on the SS board) again.
Confirm that the capstan motor rotates in the reverse direction () and that the "REVERSE OK" display appears on the monitor screen.

In case of NG;

When the capstan motor does not rotate.

Check the capstan motor.

Also check capstan motor driver circuit (DR-307/200 board).

When the capstan motor rotates normally, but the "OK" display does not appear on the monitor screen.

Check the capstan motor.

Also check the capstan FG amplifier input circuit (DR-307/200 board).

```

In case of NG;

When the cleaning roller dose not touch the drum or it is not release from the drum.

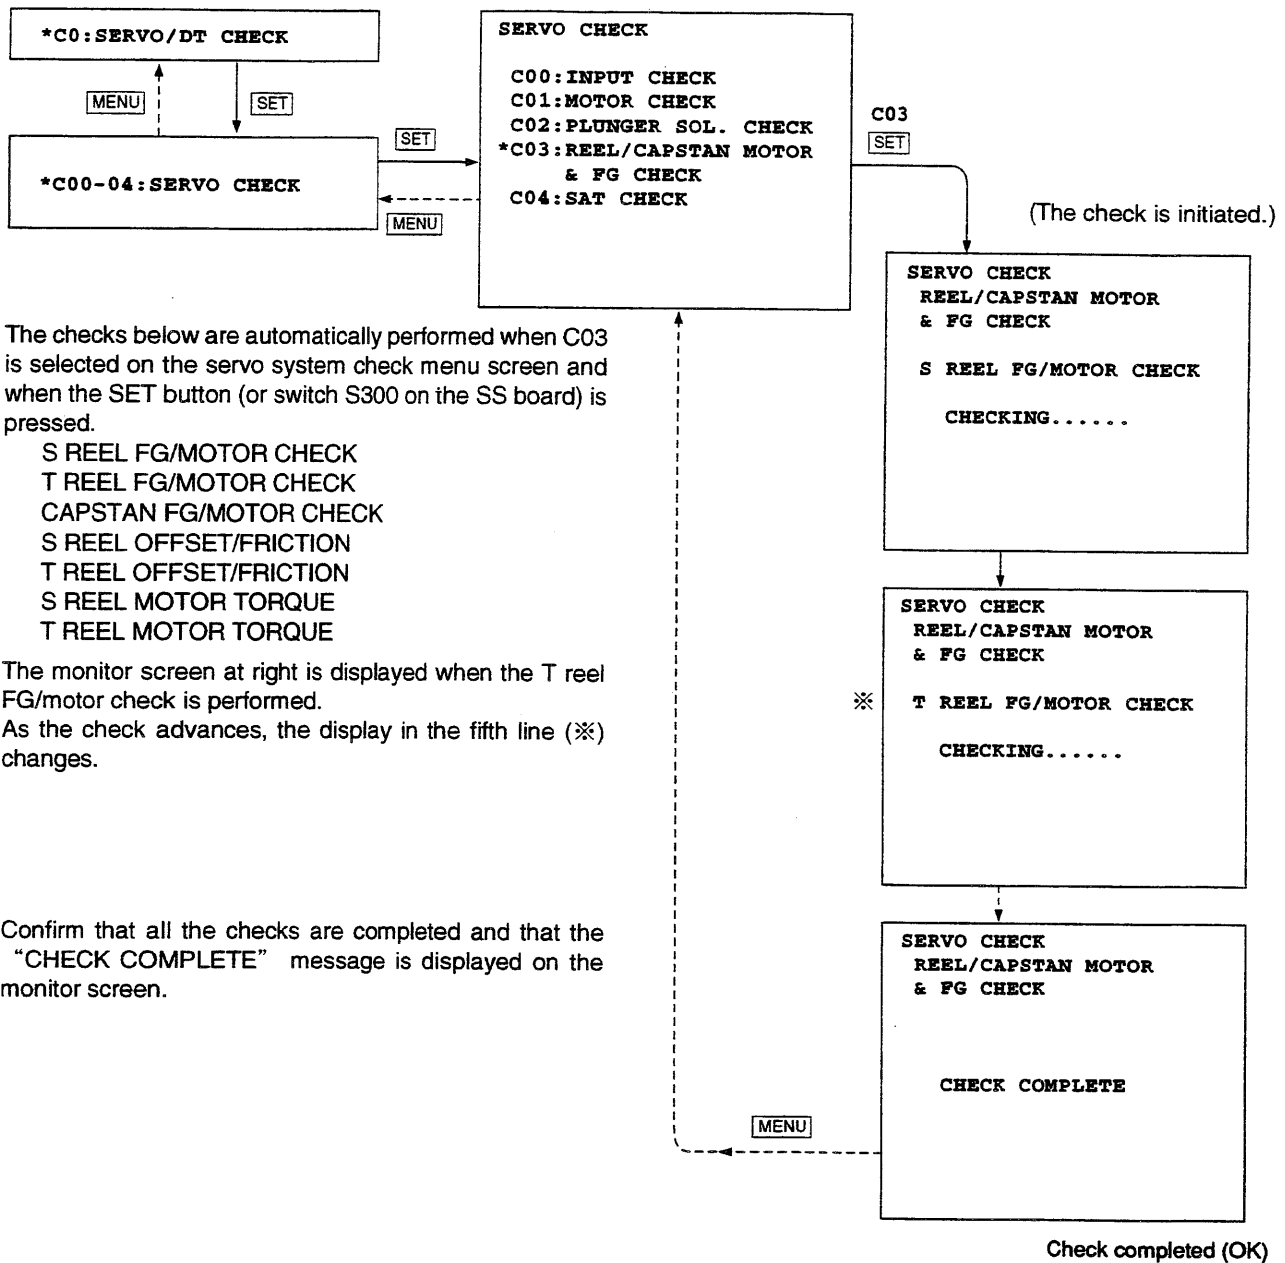

Check the cleaning roller solenoid.

Also check the solenoid driver circuit on the DR-307/200 board.

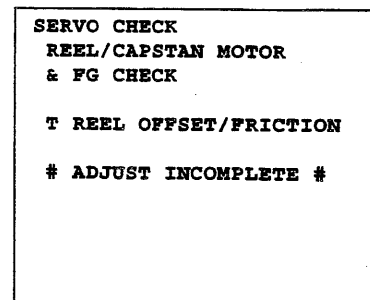

5-2-4. Servo System Check 4 (C03: REEL/CAPSTAN MOTOR & FG CHECK)

This section describes the "C03: REEL/CAPSTAN MOTOR & FG CHECK" mode.

In case of NG; (The screen at right is one example.)
When the contents of each trouble are displayed on the monitor screen, refer to the next page.

a) S REEL FG/MOTOR CHECK

Checks the duty cycle of the S reel FG.

In case of NG;

Check the S reel motor (C010: S REEL MOTOR).

If no abnormality is found, adjust the duty cycle of the S reel FG (A001: S REEL FG DUTY).

b) T REEL FG/MOTOR CHECK

Checks the duty cycle of the T reel FG.

In case of NG;

Check the T reel motor (C011: T REEL MOTOR).

If no abnormality is found, adjust the duty cycle of the T reel FG (A002: T REEL FG DUTY).

c) CAPSTAN FG/MOTOR CHECK

Checks the duty cycle of the capstan FG.

In case of NG;

Check the capstan motor (C014: CAPSTAN MOTOR).

If no abnormality is found, adjust the duty cycle of the capstan FG (A003: CAPSTAN FG DUTY).

d) S REEL OFFSET/FRICTION

Checks the offset and friction levels of the S reel.

In case of NG;

Check the S reel motor (C010: S REEL MOTOR).

If no abnormality is found, adjust the offset and friction of the S reel (A004: S REEL OFFSET/FRIC).

e) T REEL OFFSET/FRICTION

Checks the offset and friction levels of the T reel.

In case of NG;

Check the T reel motor (C011: T REEL MOTOR).

If no abnormality is found, adjust the offset and friction of the T reel (A005: T REEL OFFSET/FRIC).

f) S REEL MOTOR TORQUE

Checks the torque of the S reel.

In case of NG;

Check the S reel motor (C010: S REEL MOTOR).

If no abnormality is found, adjust the torque of the S reel (A006: S REEL TORQUE).

g) T REEL MOTOR TORQUE

Checks the torque of the T reel.

In case of NG;

Check the T reel motor (C011: T REEL MOTOR).

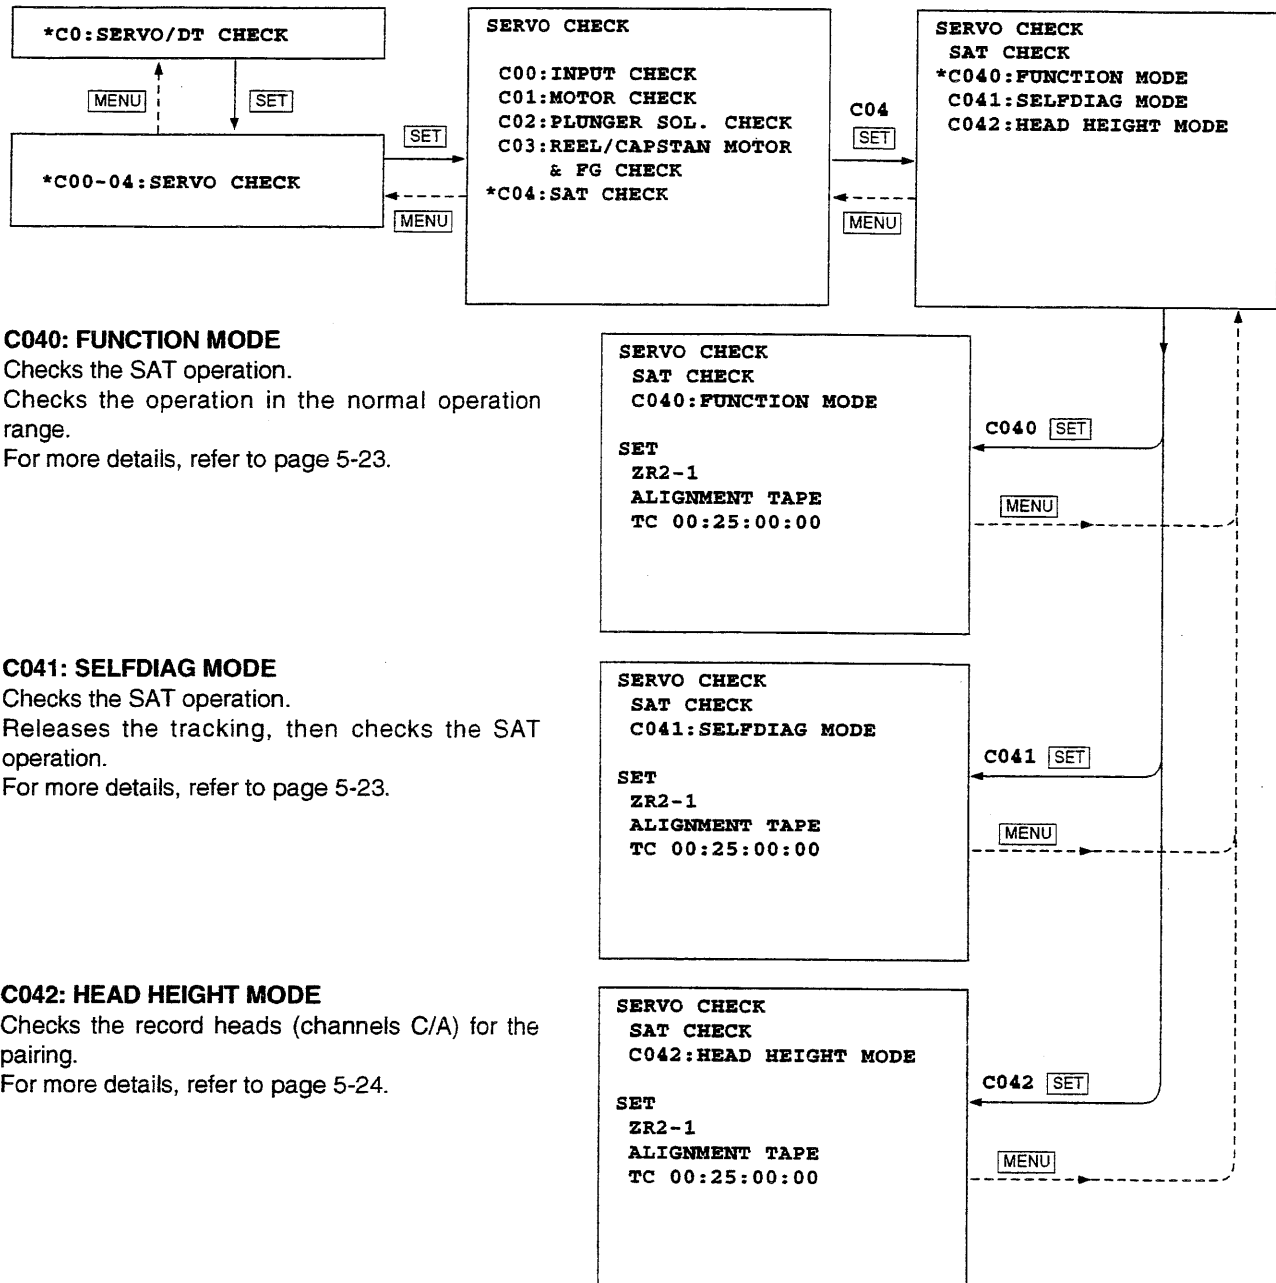

If no abnormality is found, adjust the torque of the T reel (A007: T REEL TORQUE).

5-2-5. Servo System Check 5 (C04: SAT CHECK)

This section describes the "C04: SAT CHECK" mode.

SAT; Supplemental Auto Tracking

To perform this check, alignment tape ZR2-1P/1 on which the beginning of the time code is beforehand located in "00:25:00:00" is required.

The "C042 : HEAD HEIGHT MODE" is added to the unit in which the SV 1 ROM (IC 761 on the SS board) version is 1.20 or higher.

a) C040: FUNCTION MODE

This mode checks the SAT operation in the normal operation range.

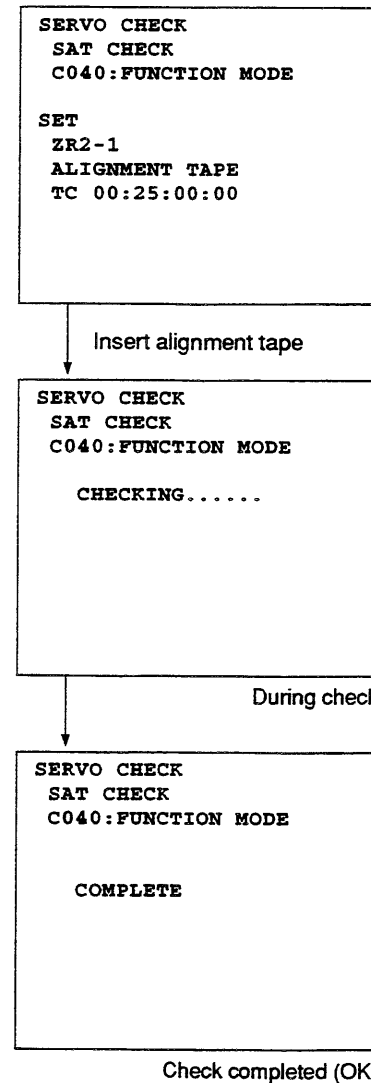

To perform this check, alignment tape ZR2-1P/1 on which the beginning of the time code is beforehand located in "00:25:00:00" is required.

When alignment tape ZR2-1P/1 is inserted into this unit, this check is initiated automatically.

ZR2-1P ; for DVW-A500P/500P
ZR2-1 ; for DVW-A500/500

During check, PLAY and STOP modes are repeated six times.

Note: When the time code remarkably differs or when another tape is used, the "TIMING SIG TROUBLE" message is displayed on the monitor screen.

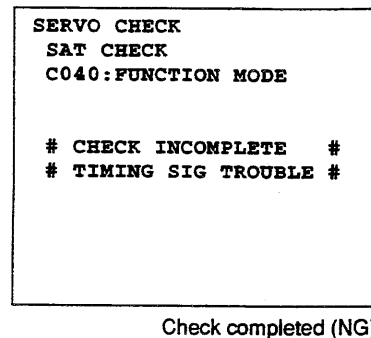

Confirm that the check is completed and that the "COMPLETE" message is displayed on the monitor screen.
After the check is completed, the alignment tape is ejected automatically.

In case of NG; (The screen at right is one example.)

When the "TIMING SIG TROUBLE" message is displayed on the monitor screen.
Check the SAT 400 kHz (TIMING SIGNAL) system circuit on the SS board.
If no abnormality is found, check the REC HEAD PB (channel A) system circuit on the EQ board.

When the "PILOTENV TROUBLE" message is displayed.

Check the SAT 4 MHz (RF ENVELOPE) system circuit on the SS board.
If no abnormality is found, check the REC HEAD PB (channel A) system circuit on the EQ board.

**b) C041: SELFDIAG MODE**

This mode checks the SAT operation after releases the tracking.

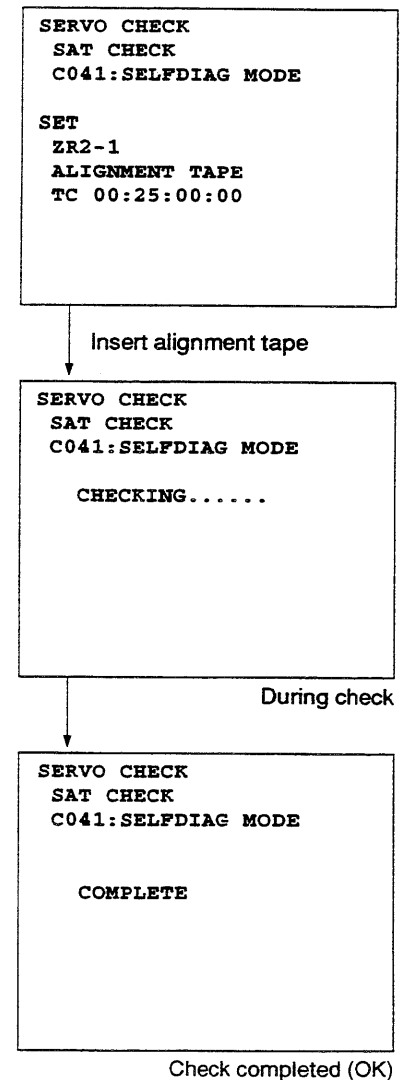

To perform this check, alignment tape ZR2-1P/1 on which the beginning of the time code is beforehand located in "00:25:00:00" is required.

When alignment tape ZR2-1P/1 is inserted into this unit, this check is initiated automatically.

ZR2-1P ; for DVW-A500P/500P
ZR2-1 ; for DVW-A500/500

During check, the unit is put into the PLAY mode.

Note: When the time code remarkably differs or when another tape is used, the "TIMING SIG TROUBLE" message is displayed on the monitor screen.

Confirm that the check is completed and that the "COMPLETE" message is displayed on the monitor screen.
After the check is completed, the alignment tape is ejected automatically.

In case of NG; (The screen at right is one example)

When the "TIMING SIG TROUBLE" message is displayed on the monitor screen.
Check the SAT 400 kHz (TIMING SIGNAL) system circuit on the SS board.
If no abnormality is found, check the REC HEAD PB (channel A) system circuit on the EQ board.

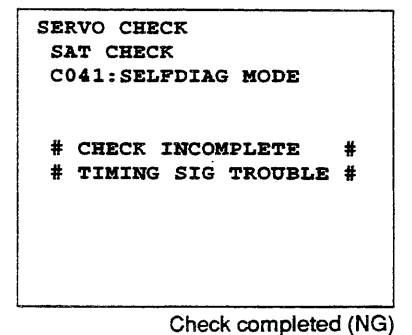

When the "PILOT ENV TROUBLE" message is displayed.

Check the SAT 4 MHz (RF ENVELOPE) system circuit on the SS board.
If no abnormality is found, check the REC HEAD PB (channel A) system circuit on the EQ board.

When the "OUT OF SPEC REC HEAD HEIGHT" messages are displayed.
Reinstall the inner drum assembly (refer to section 8-2-1), then replay this check mode.
When the same message is displayed again, replace the inner drum assembly (refer to section 8-2-1) and/or adjust the tape path (refer to section 8-4).

When the "OUT OF SPEC CTL DISTANCE" messages are displayed.
Adjusts the CTL head height. Refer to section 8-4-4.

When the "OUT OF SPEC RF SWITCHING POS." messages are displayed.
Perform the "A011:RF SWITCHING POS" in the RF system adjustment mode.

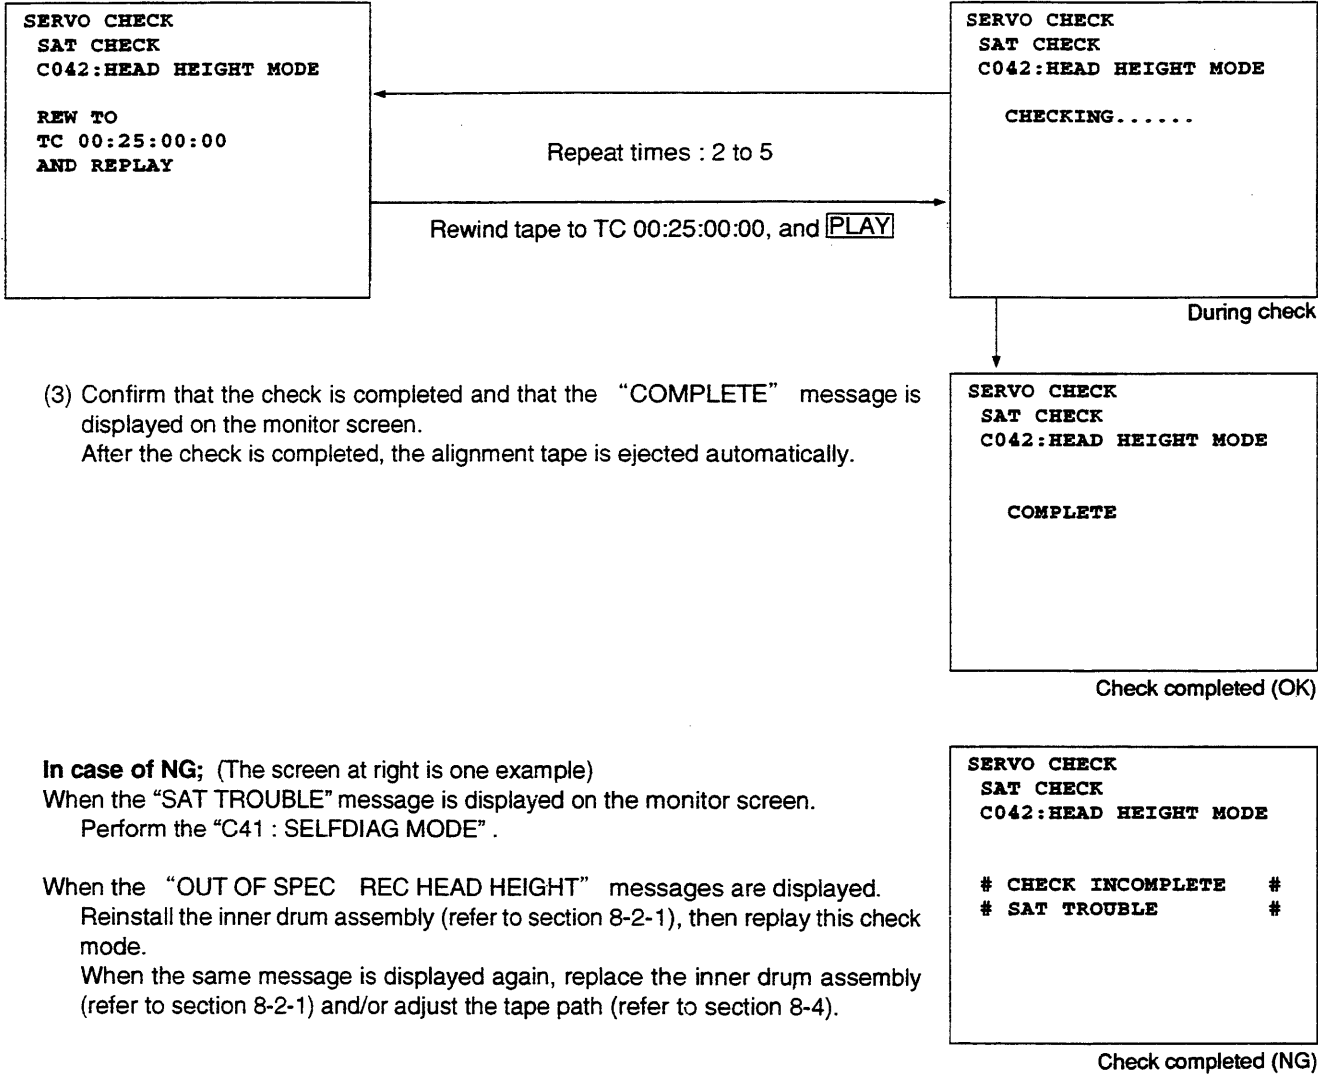

c) C042: HEAD HEIGHT MODE

This mode checks the record heads (channels C/A) for the pairing.
This mode is added to the unit in which the SV1 ROM (IC761 on the SS board) version is 1.20 or higher.

To perform this check, alignment tape ZR2-1P/1 on which the beginning of the time code is beforehand located in "00:25:00:00" is required.

- (1) When alignment tape ZR2-1P/1 is inserted into this unit, this check is initiated automatically.
During check, the unit is put into the PLAY mode.

ZR2-1P ; for DVW-A500P/500P
ZR2-1 ; for DVW-A500/500
- (2) Rewind the alignment tape ZR2-1P/1 to the time code "00:25:00:00" after the "REW TO TC 00:25:00:00 AND REPLAY" message is displayed on the monitor screen.
Press the PLAY button to resume check.
Repeat the above procedure two through five times until check is completed.

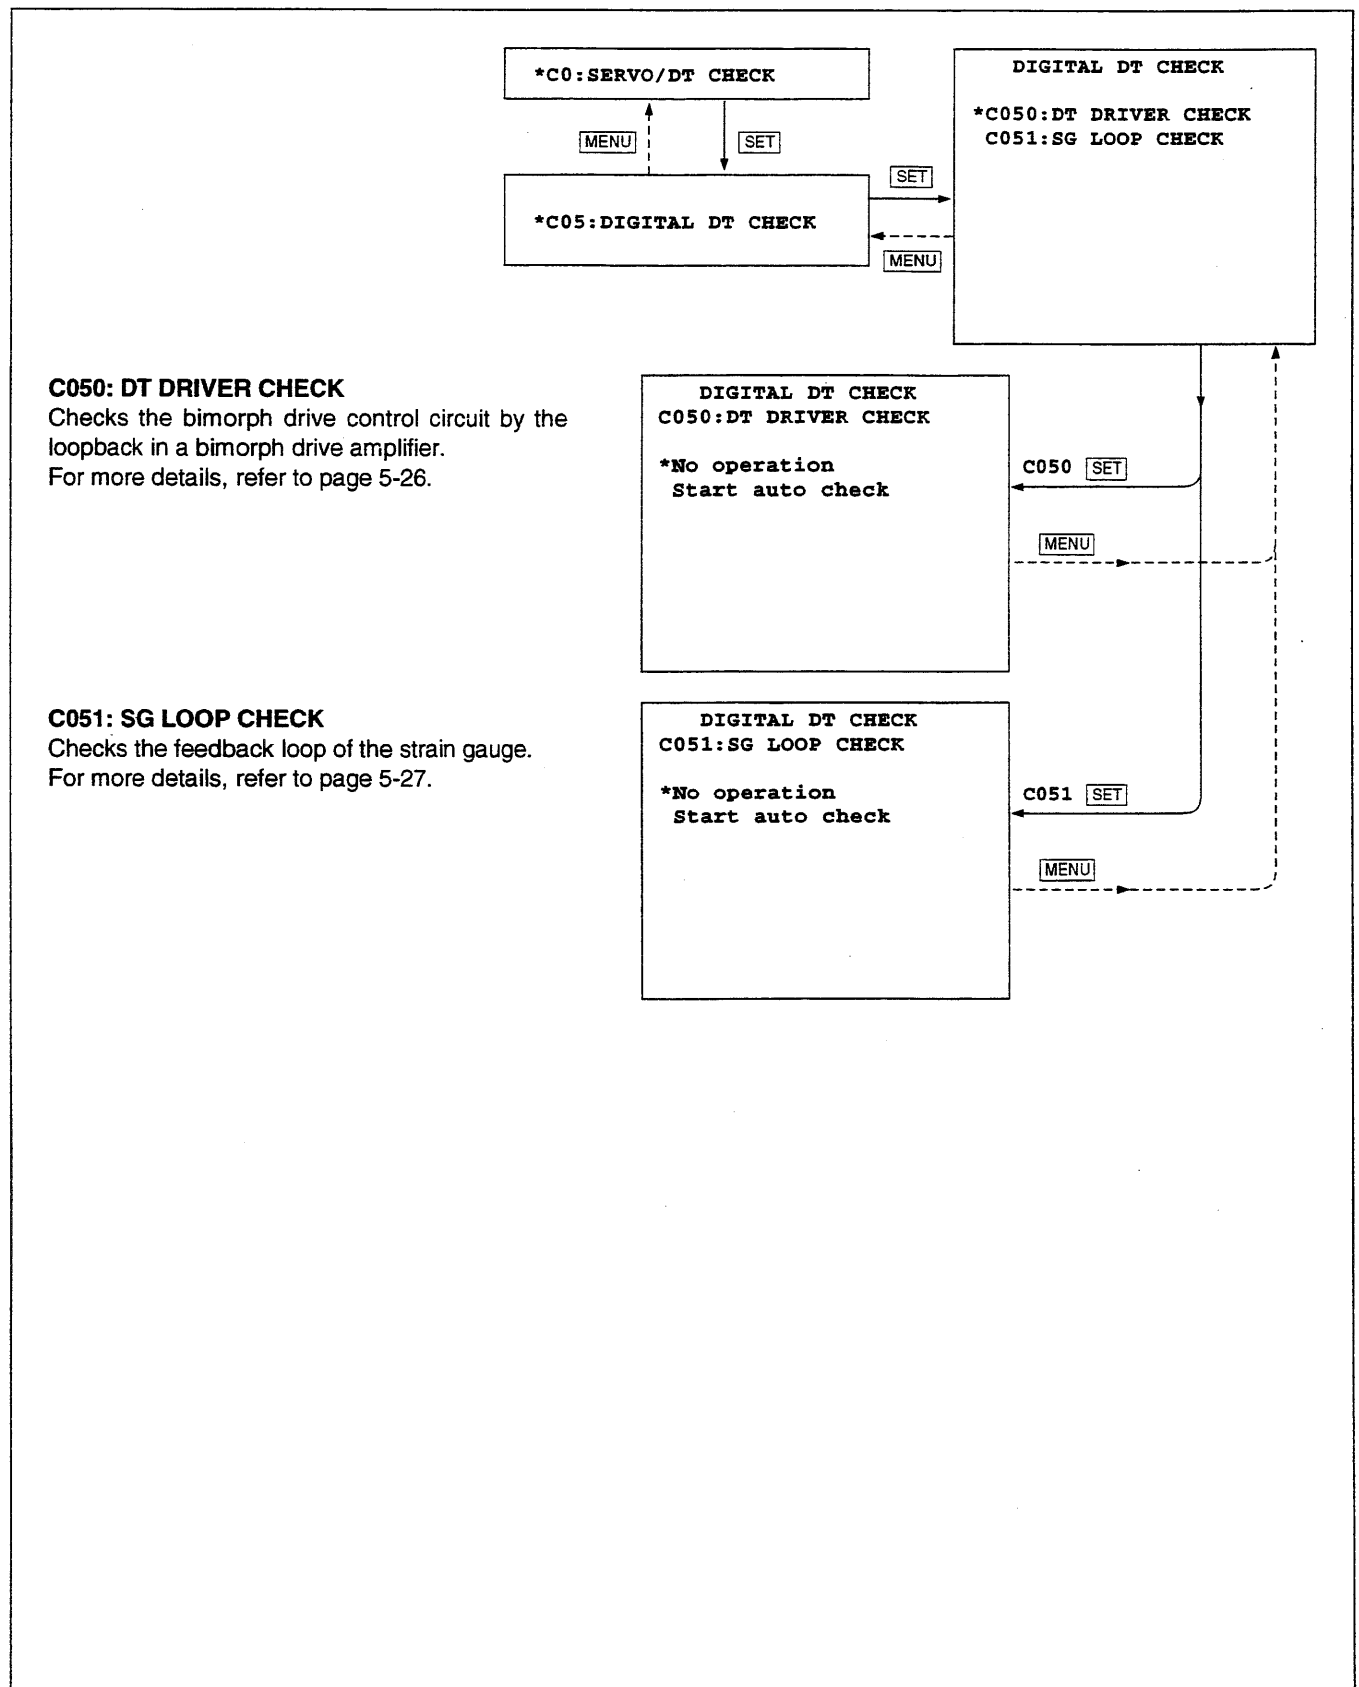

In case of NG; (The screen at right is one example)
When the "SAT TROUBLE" message is displayed on the monitor screen.
Perform the "C41 : SELFDIAG MODE" .

When the "OUT OF SPEC REC HEAD HEIGHT" messages are displayed.
Reinstall the inner drum assembly (refer to section 8-2-1), then replay this check mode.
When the same message is displayed again, replace the inner drum assembly (refer to section 8-2-1) and/or adjust the tape path (refer to section 8-4).

5-2-6. Digital DT System Check (C05: DIGITAL DT CHECK)

This section describes the "C05: DIGITAL DT CHECK" mode.

a) C050: DT DRIVER CHECK

This mode checks the bimorph drive control circuit (on the SS board) by the loopback in a bimorph drive amplifier (on the DT-34 board).

(1) Set the "*" mark to "Start auto check" using a search dial (JOG mode).

(2) When the SET button (or switch S300 on the SS board) is pressed after the "Push SET button" message is displayed, this check is initiated.

(3) Confirm that the check is completed and that the "CHECK COMPLETE" message is displayed on the monitor screen.

```

DIGITAL DT CHECK
C050:DT DRIVER CHECK

*No operation
Start auto check
  
```

(1) DIAL
(2) or

```

DIGITAL DT CHECK
C050:DT DRIVER CHECK

No operation
*Start auto check

CHECKING.....
  
```

During check

```

DIGITAL DT CHECK
C050:DT DRIVER CHECK

No operation
*Start auto check

CHECK COMPLETE
  
```

Check completed (OK)

In case of NG; (The screen at right is one example.)

When the "CHECK COMPLETE" message is not displayed on the monitor screen.

Check bimorph drive amplifier (DT-34 board) and slip ring.

Also check the bimorph drive control circuit (SS board).

```

DIGITAL DT CHECK
C050:DT DRIVER CHECK

No operation
*Start auto check

# CHECK INCOMPLETE #
A/Bch
  
```

Check completed (NG)

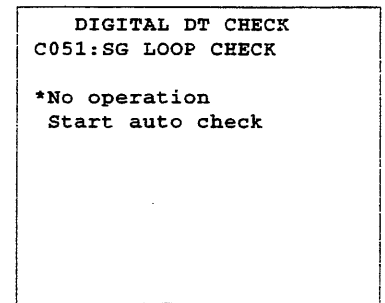

b) C051: SG LOOP CHECK

This mode checks the feedback loop of the strain gauge.

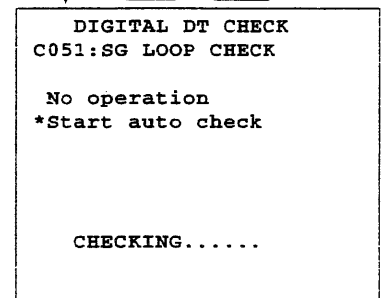

(1) Set the "*" mark to "Start auto check" using a search dial (JOG mode).

(2) When the SET button (or switch S300 on the SS board) is pressed after the "Push SET button" message is displayed, this check is initiated.

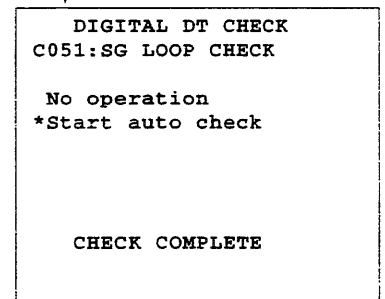

(3) Confirm that the check is completed and that the "CHECK COMPLETE" message is displayed on the monitor screen.

(1) DIAL
(2) **SET** or **S300**

During check

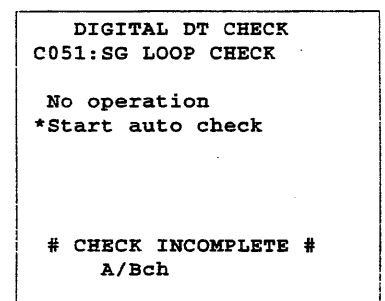

Check completed (OK)

In case of NG; (The screen at right is one example.)

When the "CHECK COMPLETE" message is not displayed on the monitor screen.

Execute the DT driver check (C050: DT DRIVER CHECK).

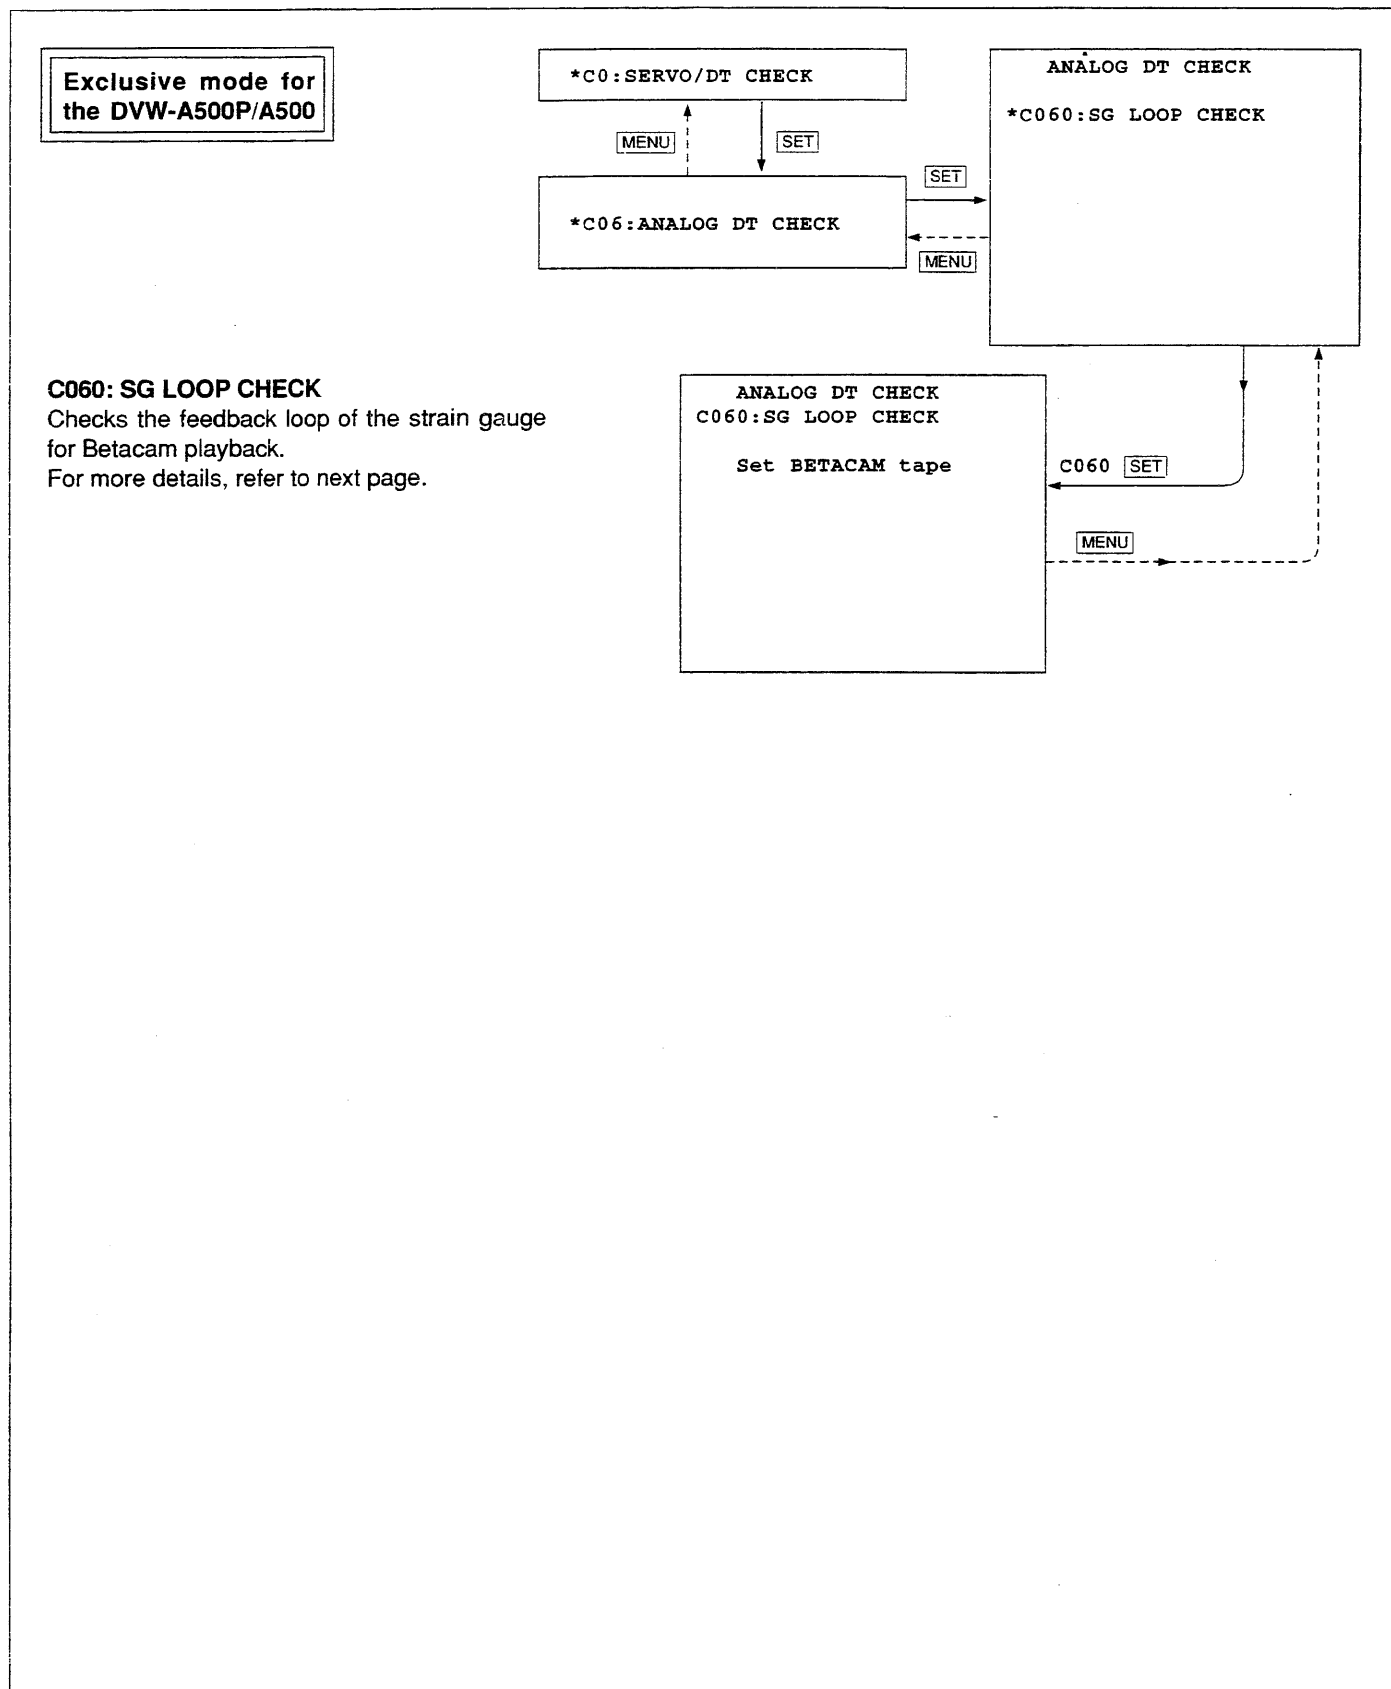

If no abnormality is found in this case, check the advance head/strain gauge of the inner drum or its signal transmission system (slip ring etc.).

Check completed (NG)

5-2-7. Analog DT System Check (For DVW-A500P/A500) (C06: ANALOG DT CHECK)

This section describes the "C06: ANALOG DT CHECK" mode.

a) C060: SG LOOP CHECK

This mode checks the feedback loop of the strain gauge for Betacam playback.

When a Betacam cassette tape is inserted into this unit, this check is initiated automatically.

(To put the unit into the Betacam PB mode, the Betacam cassette tape is inserted irrespective of its contents.)

Confirm that the check is completed and that the "CHECK COMPLETE" message is displayed on the monitor screen.

Press the MENU button (or switch S301 on the SS board) two times to return to the servo/DT system check mode menu. The cassette tape is ejected automatically.

In case of NG; (The screen at right is one example.)

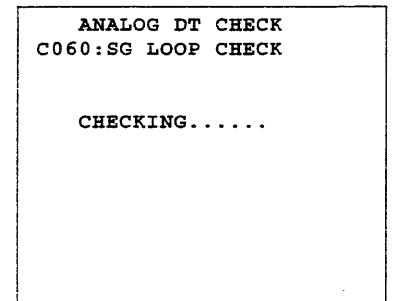

When the "CHECK COMPLETE" message is not displayed on the monitor screen.

Execute the strain gauge loop check (C051: SG LOOP CHECK) in the digital DT system.

If no abnormality is found, check the Betacam PB bimorph head/strain gauge of the inner drum or its signal transmission system (slip ring etc.).

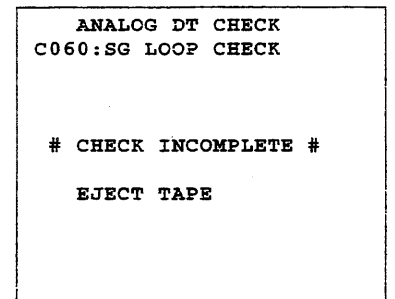

Insert a Betacam cassette tape

During check

Check completed (OK)

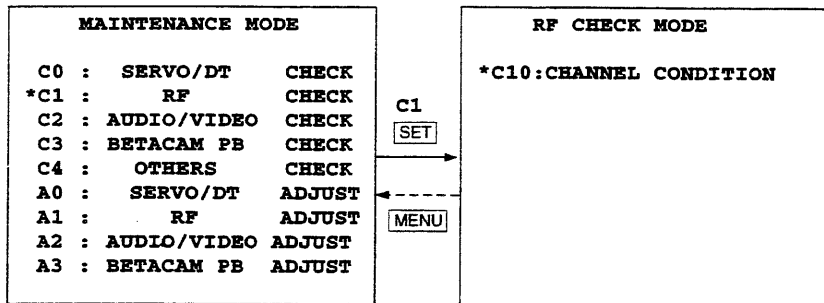

Check completed (NG)

5-3. RF SYSTEM CHECK MODE (C1: RF CHECK)

This mode can check the RF system. (Do it with the pre-read off.)

For how to activate and terminate the maintenance mode, refer to page 5-3.

(Above screen is displayed for the DVW-A500P/A500.)

C10: CHANNEL CONDITION

Can display the error condition in all the video and audio channels during REC and PB in units of three stages on the monitor screen.

For more details, refer to next page.

a) C10: CHANNEL CONDITION

This mode can display the error condition in all the video and audio channels during REC and PB in units of three stages on the monitor screen.

The channel condition indicator on the upper control panel indicates the error condition in the worst channel among all the video and audio channels.

- (1) Press the SET button (or switch S300 on the SS board) on the screen at right.
At that time, the unit temporarily exits the maintenance mode. This enables the normal operation.
(Prompt "■" is displayed in the upper right position of the superimposed screen, and the time counter is put into the normal state.)

- (2) Insert the cassette tape recorded by the digital Betacam and play back it, or insert the no-recorded cassette tape and record it. The ">>>" display then appears on the monitor screen.

During PB, the channel condition can be displayed in the modes below.

PLAY
STILL
VAR (FWD/REV)
SHUTTLE (FWD/REV)---1 to 3 times the normal speed
JOG (FWD/REV)

Confirm that the ">>>" display appears in the Grn position in all the channels.

- (3) To terminate the operation, stop the tape running and eject the cassette tape.
(The ">>>" display disappears.)
Press the MENU button (or switch S301 on the SS board) to return to the maintenance mode.
(The "■" display disappears on the monitor screen, and the time counter displays menu number C10.)

When the ">>>" display appears in positions other than "Grn", clean the drum (rotary heads).

- (a) Cleaning by the cleaning tape (Refer to Section 1-11-1.)

*Cleaning time is five seconds.

- (b) Cleaning by the cleaning cloth (Refer to Section 1-11-2.)

If the channel condition is not improved after performing the step (a) and (b), there is a possibility to improve the situation by use of cleaning tape repeatedly.

It should be less than 4 times of 5 seconds cleaning in total.

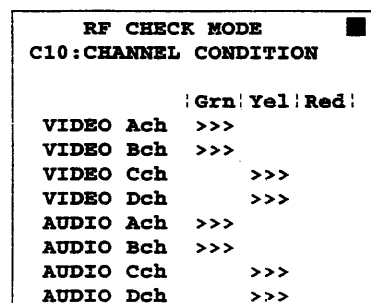

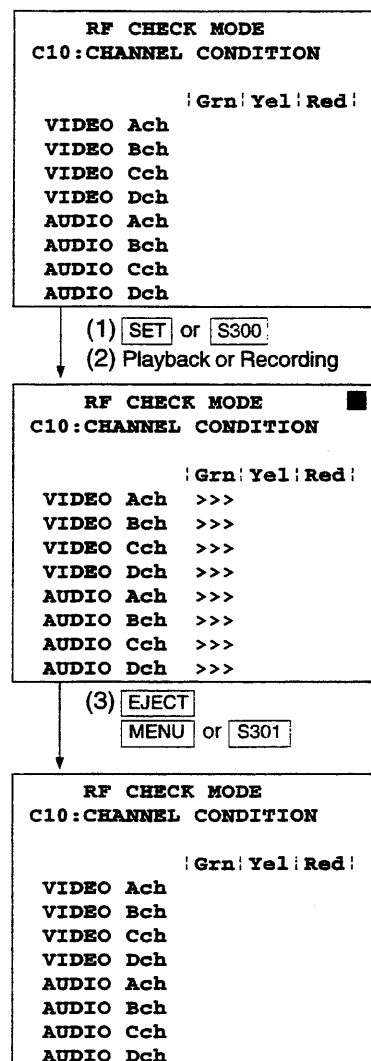

If the channel condition is not improved in the way mentioned above, the possible causes below are considered.

Playback tape fault: • The tape is damaged.

- The recording state is bad.

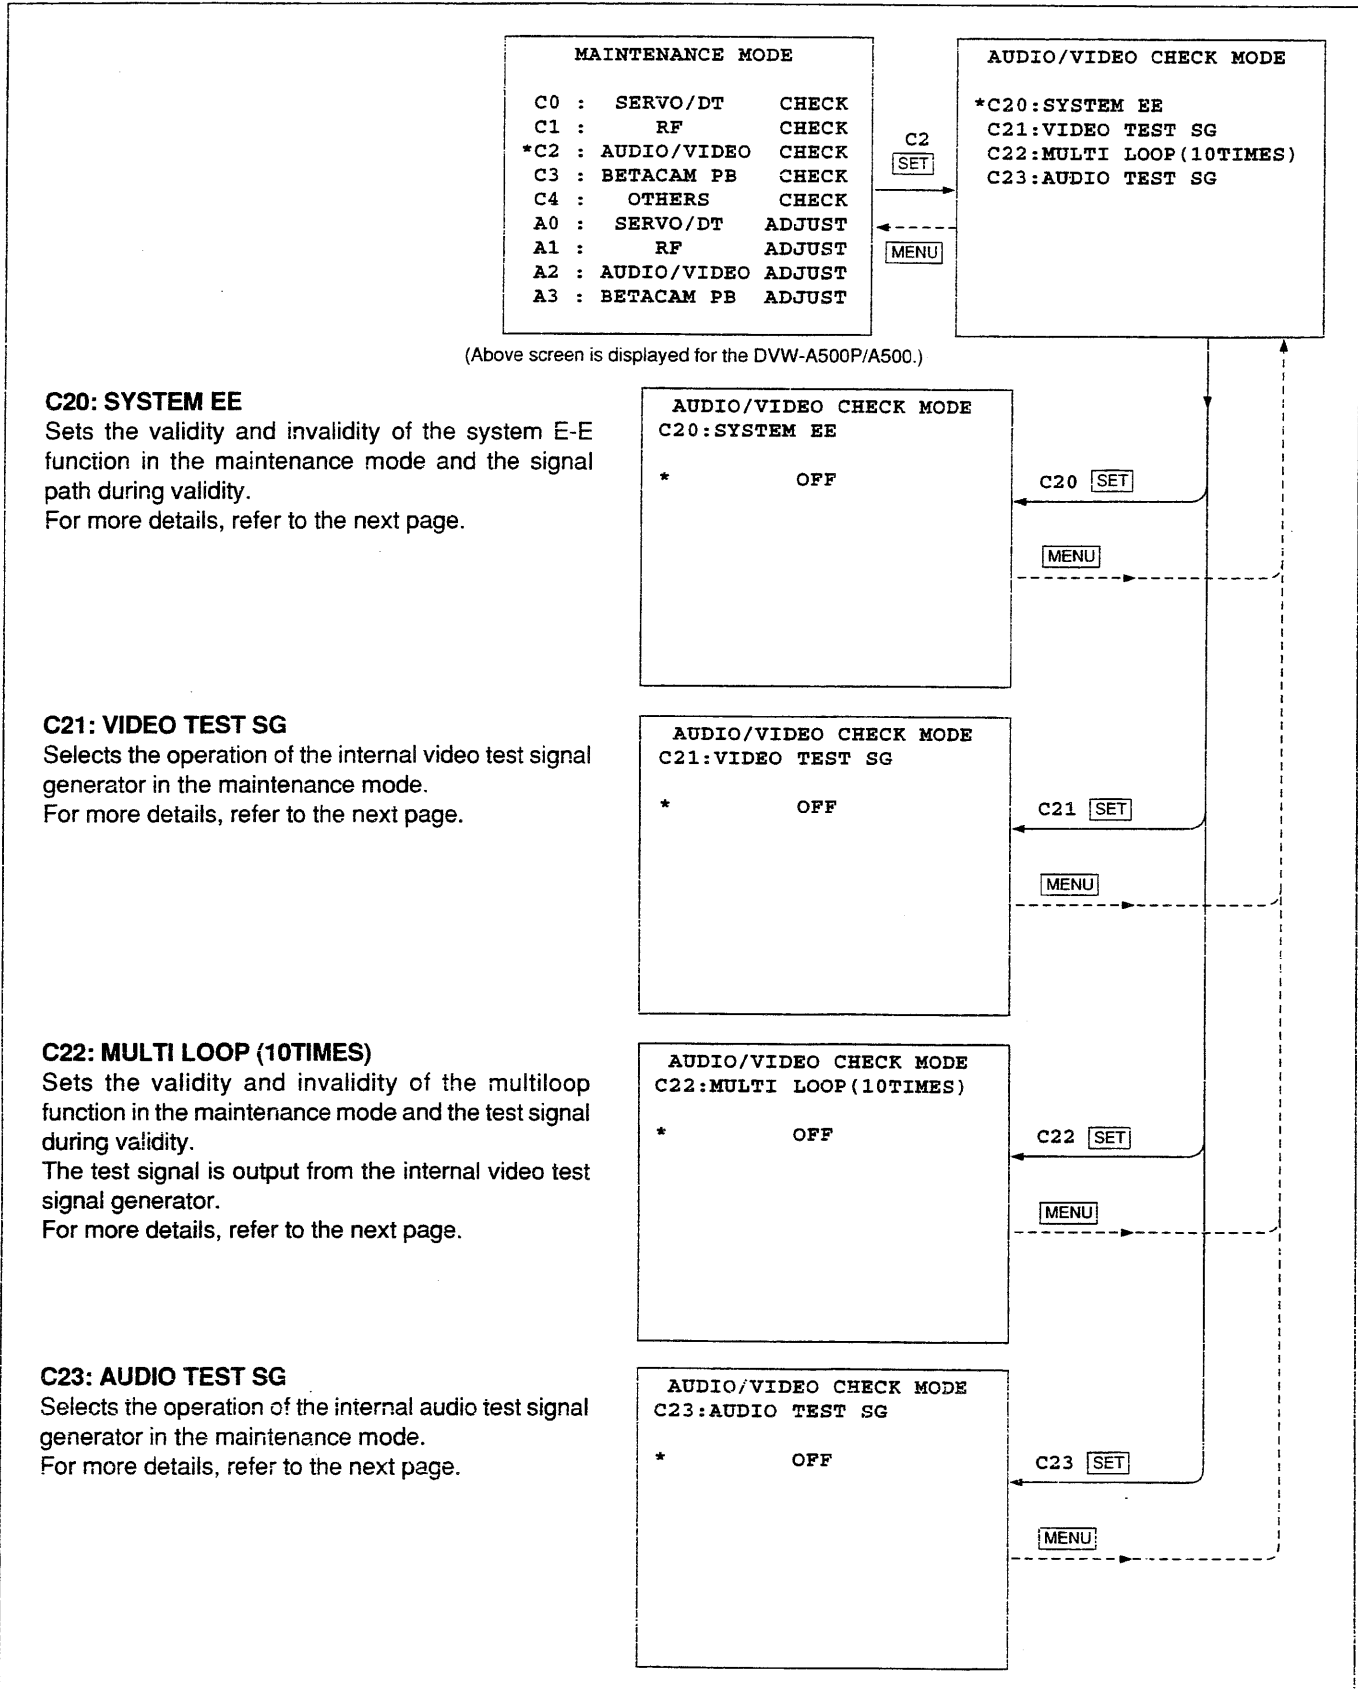

Main unit faults:

- Tape running system adjustment defect/part installation defect
- RF system adjustment defect
- DT system adjustment defect
- Worn head
- Harness defect
- Brush/Slip ring defect
- Circuit defect

5-4. AUDIO/VIDEO SYSTEM CHECK MODE (C2: AUDIO/VIDEO CHECK)

This mode sets the system E-E function and multiloop function operations during maintenance mode execution. It also can set the operation of an audio/video signal generator incorporated into this unit. For how to activate and terminate the maintenance mode, refer to page 5-3.

a) C20: SYSTEM EE

This mode selects Bypass E-E in the normal operation or System E-E in the maintenance mode execution. There are three types of signal path in System E-E.

OFF: Normal state (Bypass E-E, not System E-E)

DPR: System E-E that returns the video/audio signal after digital process on the DPR board.

RF1: System E-E with the video/audio signal returned in the input interface IC103 on the EQ board, and sent to DPR board.

RF2: System E-E returns the video/audio signal after passing EQ circuit except head.

Selection method

To display the desire setting, turn the search dial while pressing the JOG (or SHUTTLE) button. The system E-E state specified in this case is maintained until the maintenance mode is terminated or until this setting is changed.

b) C21: VIDEO TEST SG

This mode selects the operation of the internal video test signal generator in the maintenance mode. However, this selection is disabled when a multiloop function is enabled.

OFF: Stops the operation of the video test signal generator.

Except OFF (mentioned below):

Outputs a selected signal from the video test signal generator.

100% color bars

75% color bars

75% reverse color bars

Bowtie

Pulse and bar

Multi burst

H sweep

5-step

Ramp

Shallow ramp

Red signal

50% flat

100% flat

Black burst

Pathological check code

Line 330 (625)------ DVW-A500P/500P only

NTC7 (NTSC)------ DVW-A500/500 only

Selection method

To display the desire setting, turn the search dial while pressing the JOG (or SHUTTLE) button. The test signal specified in this case is continuously output from a video test signal generator until the maintenance mode is terminated or until this setting is changed.

This signal can also be recorded on the tape.

c) C22: MULTI LOOP (10 TIMES)

This mode selects validity and invalidity of the multiloop function during maintenance mode execution and the test signal during validity. The test signal that can be selected is output from the internal video test signal generator. It is the same in type as "C21: VIDEO TEST SG".

OFF: Normal state (Performs no multiloop.)

Except OFF:

Outputs the selected signal from the video test signal generator irrespective of the setting in "C21: VIDEO TEST SG" and performs the multiloop operation.

Selection method

To display the desire setting, turn the search dial while pressing the JOG (or SHUTTLE) button. A multiloop is performed using the test signal specified in this case until the maintenance mode is terminated or until this setting is changed.

d) C23: AUDIO TEST SG

This mode selects the operation of the internal audio test signal generator in the maintenance mode.

OFF: Stops the operation of the audio test signal generator.

Except OFF (mentioned below):

Outputs the selected signal from the audio test signal generator.

SILENCE

1 kHz sine 0 VU

1 kHz sine burst/1-field

1 kHz sine burst/2-field

1 kHz sine burst/5-field

1 kHz sine burst/8-field

1 kHz sine burst (10)

4 kHz sine burst (40)

SAW(sawtooth) wave

Selection method

To display the desire setting, turn the search dial while pressing the JOG (or SHUTTLE) button. The test signal specified in this case is continuously output from the audio test signal generator until the maintenance mode is terminated or until this setting is changed.

This signal can also be recorded on the tape.

5-5. BETACAM PB SYSTEM CHECK MODE (For DVW-A500P/A500) (C3: BETACAM PB CHECK)

This mode can check the Betacam PB system.

For how to activate and terminate the maintenance mode, refer to page 5-3.

**Exclusive mode for
the DVW-A500P/A500**

MAINTENANCE MODE

```

C30 SET

MENU

a) **C30: CHANNEL CONDITION**

This mode can display the error condition in Betacam PB video channels (Y and C) in units of three stages on the monitor screen.

The channel condition indicator on the upper control panel indicates the bad channel state of the error condition.

- (1) Press the SET button (or switch S300 on the SS board) on the screen at right.
At that time, the unit temporarily exits the maintenance mode. This enables the normal operation.
(Prompt "■" is displayed in the upper right position of the superimposed screen, and the time counter is put into the normal state.)

- (2) Insert the recorded Betacam cassette tape.

- (3) Press the PLAY button.
The ">>>" display then appears on the monitor screen.

Confirm that the ">>>" display appears in the "Grn" position in both channels.

- (4) To terminate the operation, stop the tape running and eject the cassette tape.
(The ">>>" display disappears.)
Press the MENU button (or switch S301 on the SS board) to return to the maintenance mode.
(The "■" display disappears on the monitor screen, and the time counter displays menu number C30.)

When the ">>>" display appears in positions other than "Grn", clean the drum (rotary heads).

- (a) Cleaning by the cleaning tape (Refer to Section 1-11-1.)

* Cleaning time is five seconds.

- (b) Cleaning by the cleaning cloth (Refer to Section 1-11-2.)

If the channel condition is not improved after performing the step (a) and (b), there is a possibility to improve the situation by use of cleaning tape repeatedly.
It should be less than 4 times of 5 seconds cleaning in total.

If the channel condition is not improved in the way mentioned above, the possible causes below are considered.

Playback tape fault:

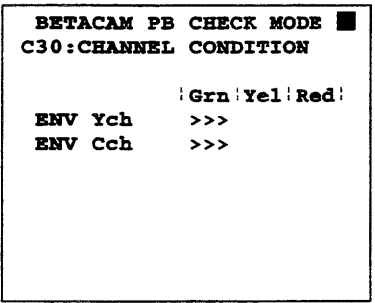

- The tape is damaged.
- The recording state is bad.

Main unit faults:

- Tape running system adjustment defect/part installation defect
- RF system adjustment defect
- DT system adjustment defect
- Worn head
- Harness defect
- Brush/Slip ring defect
- Circuit defect

- (1) SET or S300
(2) Insert a Betacam tape
(3) PLAY

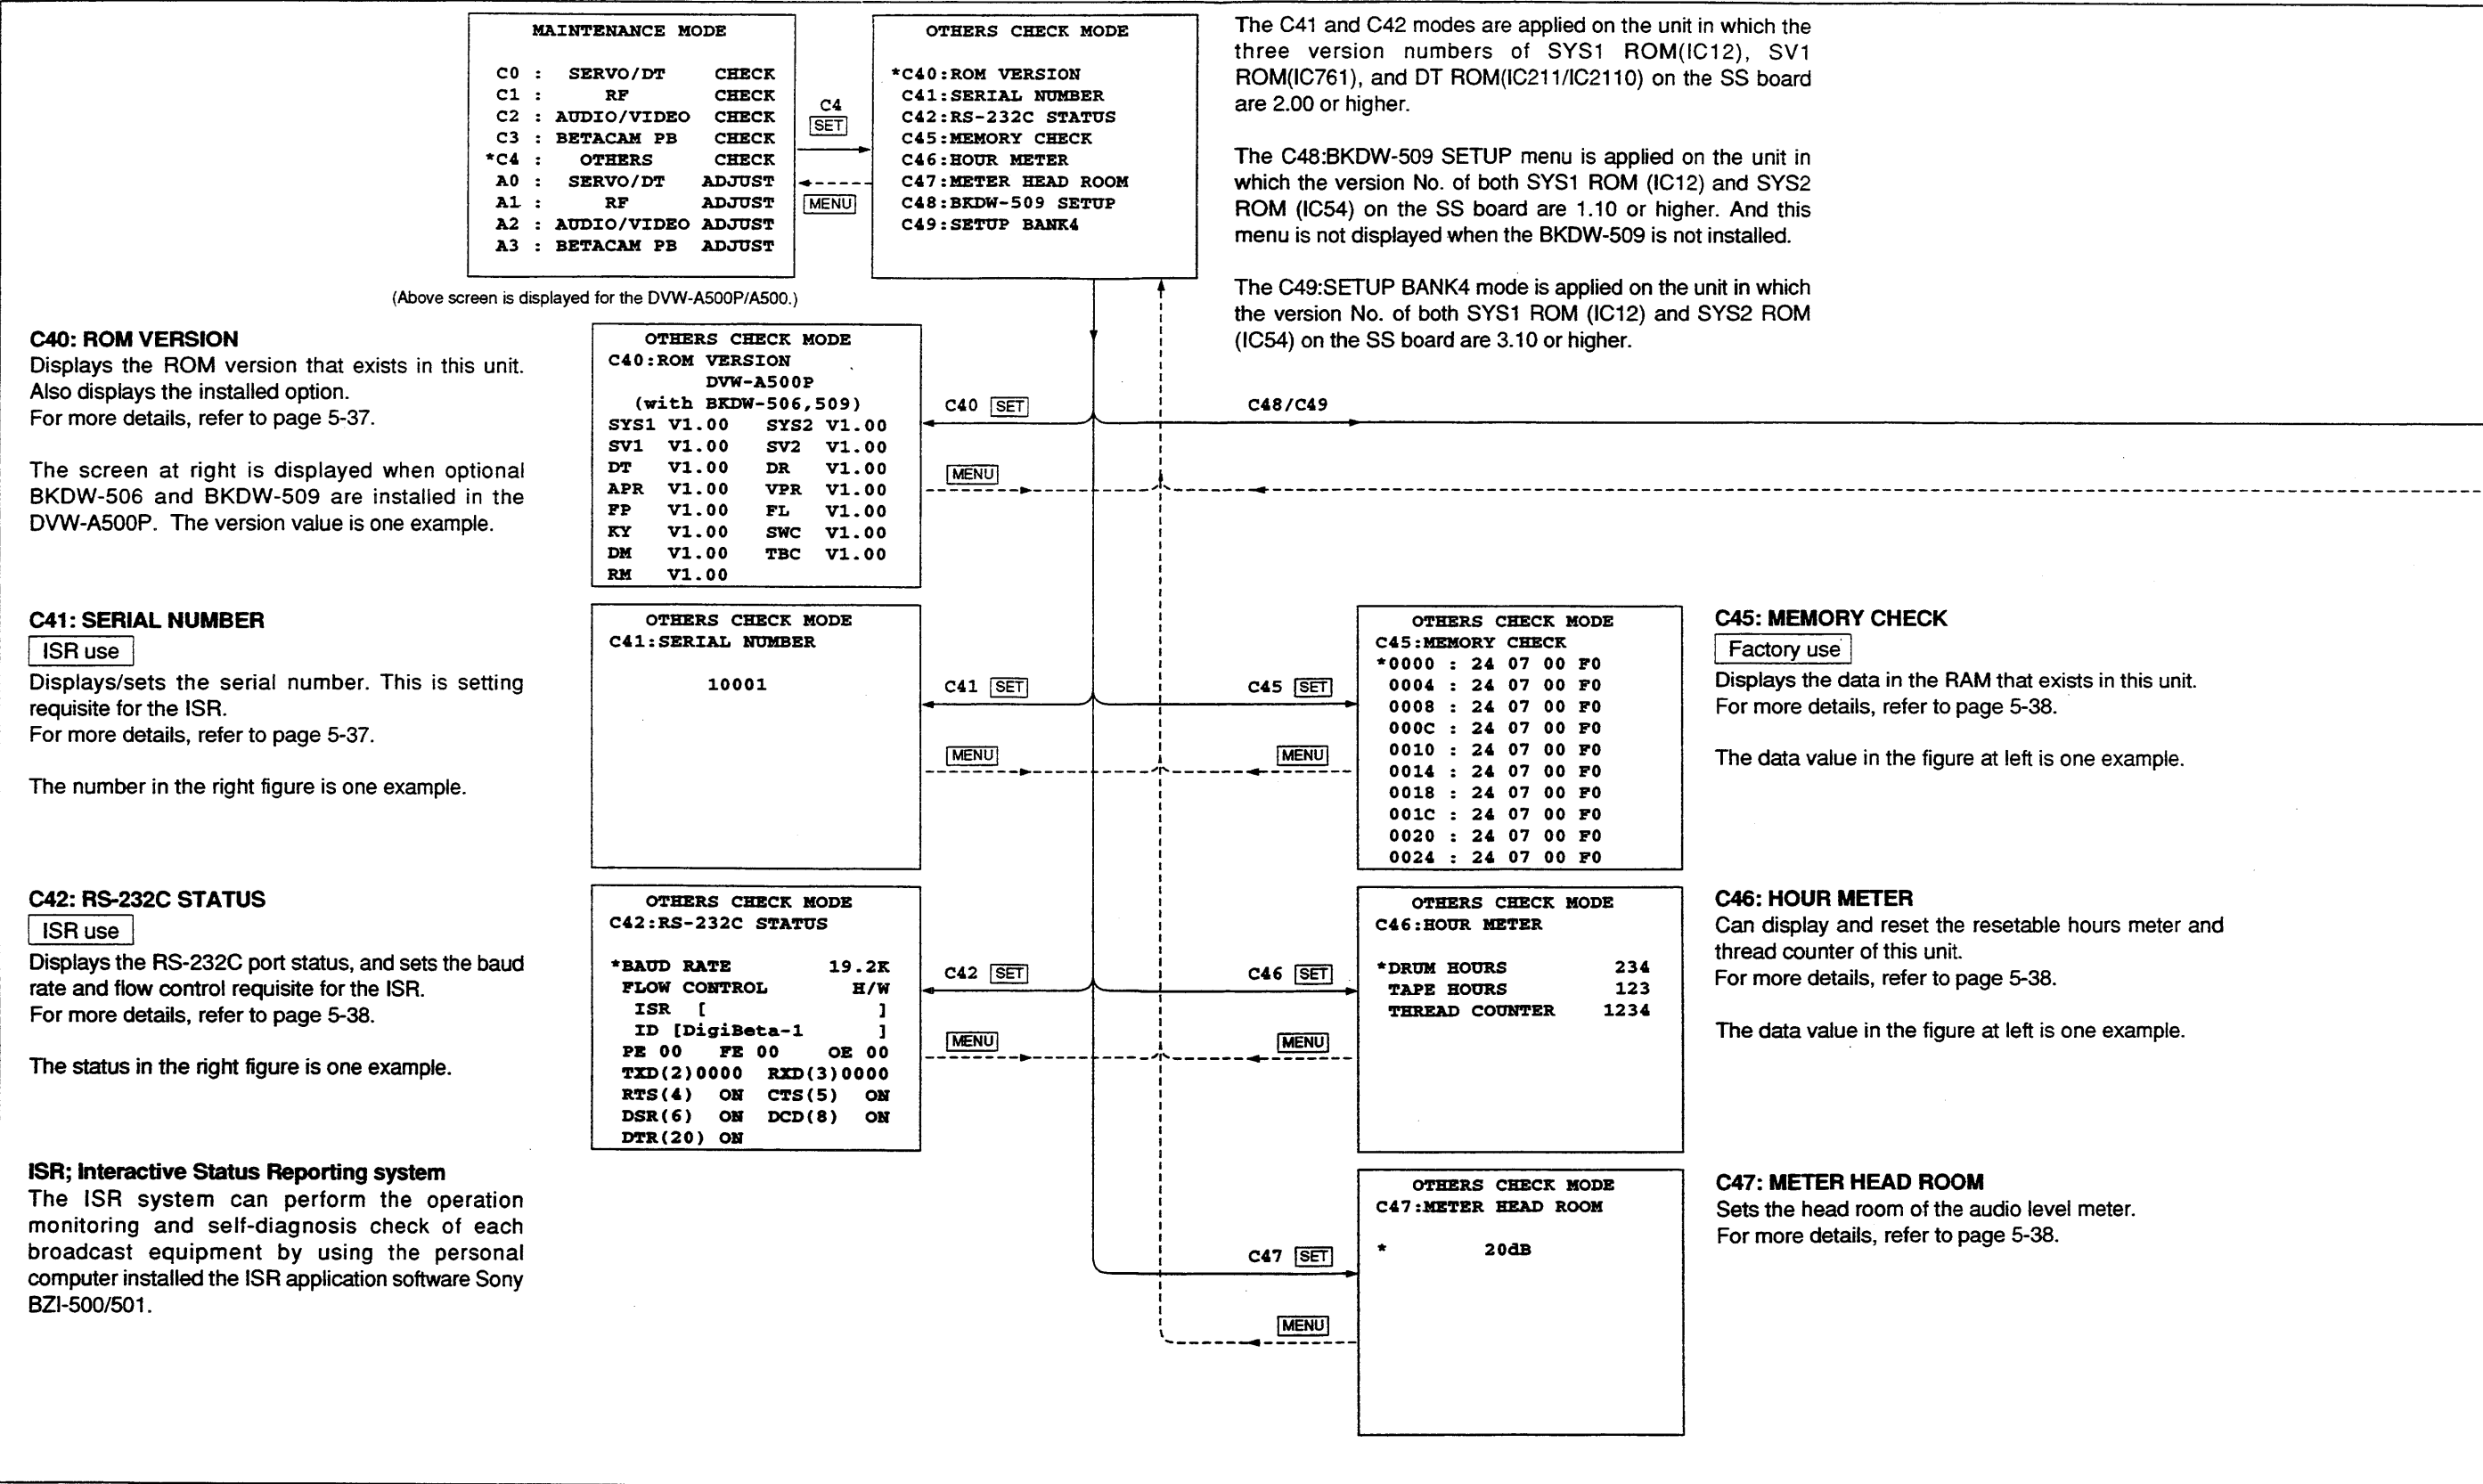

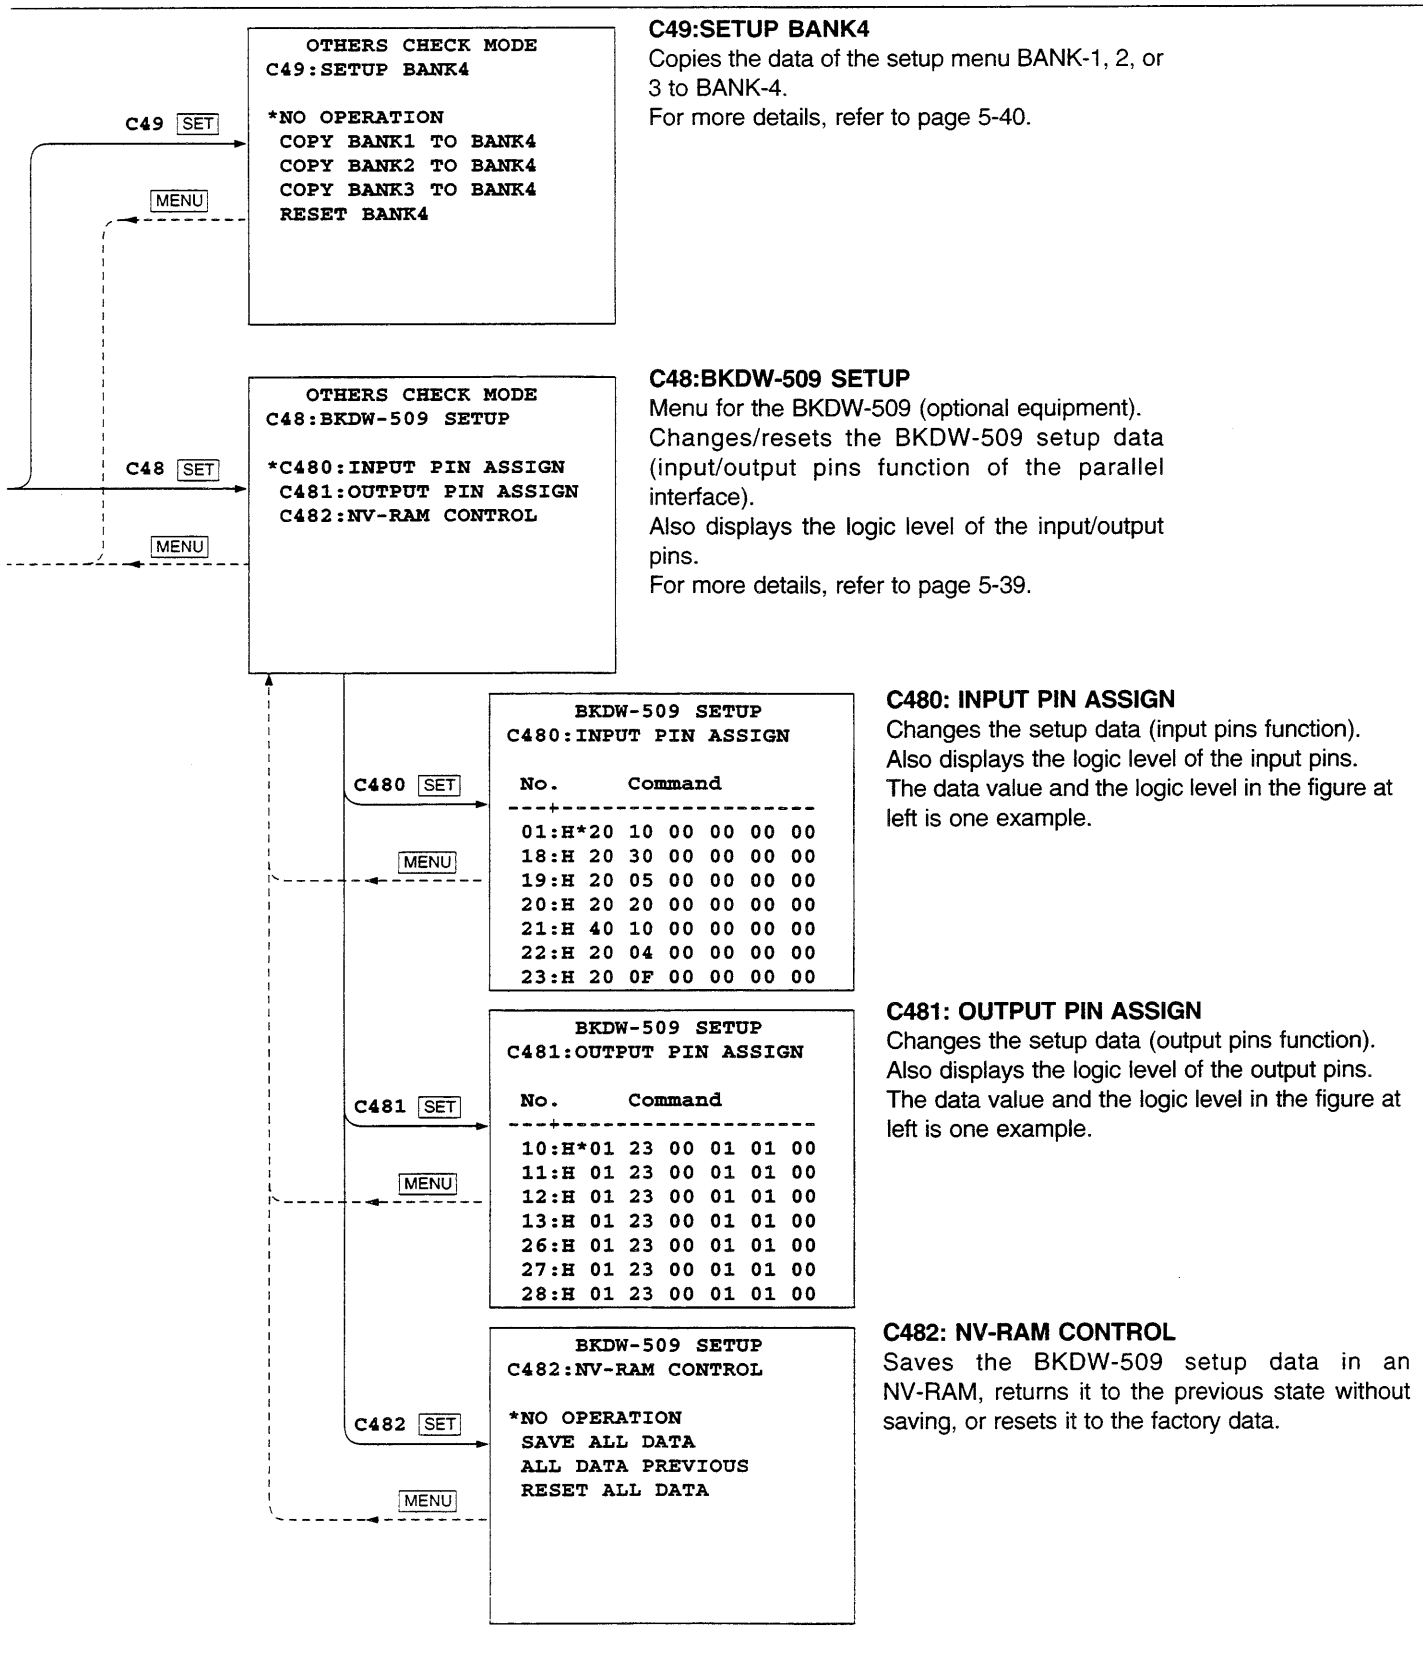

- (4) EJECT
MENU or S301

5-6. OTHERS CHECK MODE (C4: OTHERS CHECK)

This section describes the “C4: OTHERS CHECK” mode.
For how to activate and terminate the maintenance mode, refer to page 5-3.

a) **C40: ROM VERSION**

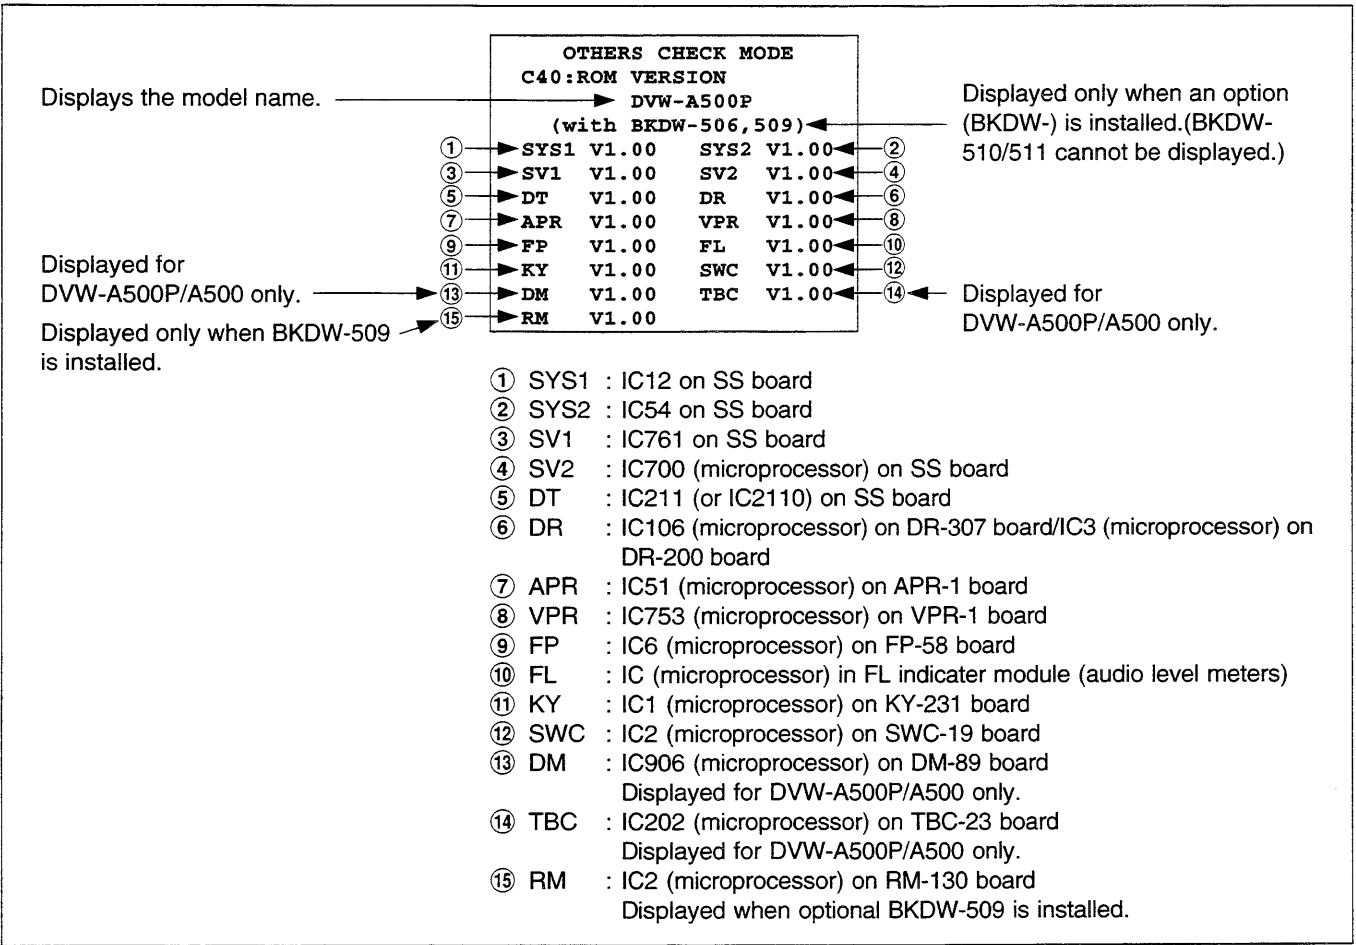

This mode displays the version of the ROM (including the ROM in a microprocessor) that exists in this unit. It also displays the installed option (BKDW-).

The screen at right is displayed when both an analog composite decoder board (BKDW-506) and parallel (50-pin) interface board (BKDW-509) are installed in the DVW-A500P.

The display description is shown below.

OTHERS CHECK MODE			
C40:ROM VERSION			
DVW-A500P			
(with BKDW-506,509)			
SYS1	V1.00	SYS2	V1.00
SV1	V1.00	SV2	V1.00
DT	V1.00	DR	V1.00
APR	V1.00	VPR	V1.00
FP	V1.00	FL	V1.00
KY	V1.00	SWC	V1.00
DM	V1.00	TBC	V1.00
RM	V1.00		

This version value is one example.

b) **C41: SERIAL NUMBER**

ISR use

Displays/sets the serial number. This is setting requisite for the ISR.
Setting performs at each digit. (Blinking a digit can change.)
Displays " ---- " when the serial number is not set.

Setting

- (1) Trun the search dial(JOG mode) to blinking digit.
- (2) Trun the search dial while pressing the JOG button to display the desire number.
- (3) For other digits to be set, repeat steps (1) and (2).
- (4) Press the SET button (or switch S300 on the SS board). Setting is then completed.

OTHERS CHECK MODE	
C41:SERIAL NUMBER	
10001	

Above screen is one example.

c) C42: RS-232C STATUS

ISR use

Displays the RS-232C port status, and sets the baud rate and flow control requisite for the ISR.

Setting (Baud rate or Flow control)

- (1) Align “*” mark with the item to be set using the search dial(JOG mode).
- (2) To display the desire setting, trun the search dial while pressing the JOG button.
- (3) Press the SET button (or switch S300 on the SS board). Setting is then completed.

The display description is shown below.

OTHERS CHECK MODE			
C42:RS-232C STATUS			
*BAUD RATE	19.2K		
FLOW CONTROL	H/W		
ISR []		
ID [DigiBeta-1]		
PE 00	FE 00	OE 00	
TXD(2)0000	RXD(3)0000		
RTS(4) ON	CTS(5) ON		
DSR(6) ON	DCD(8) ON		
DTR(20) ON			

Above screen is one example.

- ① Selects the buad rate from the followings.
1200, 2400, 4800, 9600, 19.2K (bps)

- ② Selects/changes the flow control of transmitting side from the followings.
H/W ; Hardware control
XOFF ; XON/XOFF control
H/W,XOFF ; Both the hardware and XON/XOFF

- ③ Protocol state indication
ISR x[yyyy.....]

- Displays last correctly recieving command
(Displays former recieving command till ACK transmitting is completed.)
- Displays the protocol status of the unit.
A ; on ACK transmission
N ; on NAK transmission
T ; on ATN (OPC or QRESP) transmission
W ; waiting for ACK
X ; XOFF received, waiting for XON

- ④ Device ID is displayed a name that sets by DEVID command of ISR protocol.
Even if the power is turned off, this device ID is kept till it changes by DEVID command.

- ⑤ Displays the number of the parity error (PE), framing error (FE), and overrun error (OE) of receiving data.

- ⑥ The number with () indicates the pin number of RS-232C connector.
The four figures (hexadecimal) at TXD or RXD indicates the number of correctly transmitting or recieving data (byte).
Other items indicates the pin state with ON(> +3 V) or OFF(< -3 V).
When RS-232C port connects with computer &c., normally turns all ON.
When not connected, the state of input pins (CTS, DSR, DCD) are undefined.

OTHERS CHECK MODE			
C42:RS-232C STATUS			
*BAUD RATE	19.2K		①
FLOW CONTROL	H/W		②
ISR []		③
ID [DigiBeta-1]		④
PE 00	FE 00	OE 00	⑤
TKD(2)0000	RXD(3)0000		
RTS(4) ON	CTS(5) ON		
DSR(6) ON	DCD(8) ON		⑥
DTR(20) ON			

d) C45: MEMORY CHECK

This mode displays the data in the ROM that exists in this unit (in hexadecimal).

Move the “*” mark upward or downward using a search dial (JOG mode).
The address and data display areas are then scrolled.

Factory use

OTHERS CHECK MODE			
C45:MEMORY CHECK			
*0000	:	24 07 00	F0
0004	:	24 07 00	F0
0008	:	24 07 00	F0
000C	:	24 07 00	F0
0010	:	24 07 00	F0
0014	:	24 07 00	F0
0018	:	24 07 00	F0
001C	:	24 07 00	F0
0020	:	24 07 00	F0
0024	:	24 07 00	F0

This data value is one example.

e) C46: HOUR METER

This mode can display and reset the resetable hours meter and thread counter of this unit.

Display description

DRUM HOURS : Drum rotation time
TAPE HOURS : Tape running time
THREAD COUNTER: Number of threading times

Resetting

- (1) Align the “*” mark with the item to be reset using a search dial (JOG mode).
- (2) Turn the search dial in the reverse direction while pressing the JOG (or SHUTTLE) button. The display value then becomes zero (“0”).
To return the display value to the former value after that, turn the search dial in the forward direction.
- (3) For other items to be reset, repeat steps (1) and (2).
- (4) Press the SET button (or switch S300 on the SS board). Resetting is then completed.

OTHERS CHECK MODE			
C46:HOOR METER			
*DRUM HOURS		234	
TAPE HOURS		123	
THREAD COUNTER		1234	

This value is one example.

f) C47: METER HEAD ROOM

This mode selects the head room of the audio level meter from the following.
20 dB, 18 dB, 16 dB, 15 dB^{*1}, 14 dB, 12 dB, 9 dB^{*1}-----when DVW-A500P/500P
20 dB, 18 dB, 16 dB, 14 dB, 12 dB-----when DVW-A500/500

Selection method

- (1) To display the desire setting, turn the search dial while pressing the JOG (or SHUTTLE) button.
- (2) Press the SET button (or switch S300 or the SS board). Setting is then completed.

*1; These head rooms are added to the unit in which the APR microprocessor (IC753 on the APR board) version is 1.04 or higher, and FL microprocessor (in audio level meter) version is 1.01.

OTHERS CHECK MODE			
C47:METER HEAD ROOM			
*		20dB	

g) C48 : BKDW-509 SETUP

This menu changes/resets the BKDW-509 setup data (input/output pins function of the parallel interface). Also displays the logic level of the input/output pins. This menu is not displayed when the BKDW-509 is not installed.

The C480 mode changes the setup data of the input pins function, and displays the logic level of it.

The C481 mode changes the setup data of the output pins function, and displays the logic level of it.

The C482 mode saves the setup data in an NV-RAM, returns it to the previous state without saving, or resets it to the factory data.

The C48 menu is applied on the unit in which the version No. of both SYS1 ROM (IC12) and SYS2 ROM (IC54) on the SS board are 1.10 or higher.

(The BKDW-509 does not operate when the above two ROM's version No. are each less than 1.10. To operate the version-up of the two ROMs is required.)

(The monitor screen is displayed as an example of "C480 : INPUT PIN ASSIGN". The displayed data value and logic level are an example.)

Display Description

The pin numbers are displayed at the column of "No.".

Also the right at the pin number is displayed the logic level state (H;high, L;low).

The monitor screen is scrolled and displayed.

Operation during data changing

(1) Set "*" mark to the left of data to be adjusted using a search dial (JOG mode).

(2) Turn the search dial to change the data while pressing the JOG (or SHUTTLE) button.

FWD (○): Increases the data value.
REV (○): Decreases the data value.

(3) For any other data, repeat steps (1) and (2).

(4) After change is completed, press the MENU button (or switch S301 on the SS board) to return to the BKDW-509 SETUP menu screen.

(5) To save the adjustment data in an NV-RAM, execute the "C482: NV-RAM CONTROL" mode.

*C482: NV-RAM CONTROL

Caution

If to change the setup data, and/or the version-up of the ROMs, please contact to Sony's service organization.

Do not change the setup data carelessly. This causes a trouble.

If the adjustment data been changed carelessly, execute the "ALL DATA PREVIOUS" mode in C482 : NV-RAM CONTROL or turn off the power of this unit without executing the C482 : NV-RAM CONTROL.

Never execute the "SAVE ALL DATA" mode.

C482 : NV-RAM CONTROL

Caution : Once the BKDW-509 setup data is saved in an NV-RAM, it cannot return to the previous state.

- Using a serch dial (JOG mode), set the "*" mark as follows;
Set it to "SAVE ALL DATA" when the setup data after change is saved.
Set it to "ALL DATA PREVIOUS" when the setup data before change is returned.
Set it into "RESET ALL DATA" when the setup data resets to the factory data.

- Press the SET button (or switch S300 on the SS board) to initiate the data transfer.

The monitor screen at right is displayed when the setup data is saved/reseted. The "Loading ..." message is displayed when the setup data before change is returned.

- After data transfer is completed, the "Complete" message is displayed on the monitor screen.
The monitor screen at right is displayed when the setup data is saved/reseted. The "Load Complete" message is displayed when the setup data befor adjustment is returned.

Note : If the power of this unit is turned off without saving the BKDW-509 setup data in an NV-RAM after change is completed, the setup data returns to the previous state.

(1) DIAL
(2) SET or S300

During data saving

Data saving completed

C49: SETUP BANK4

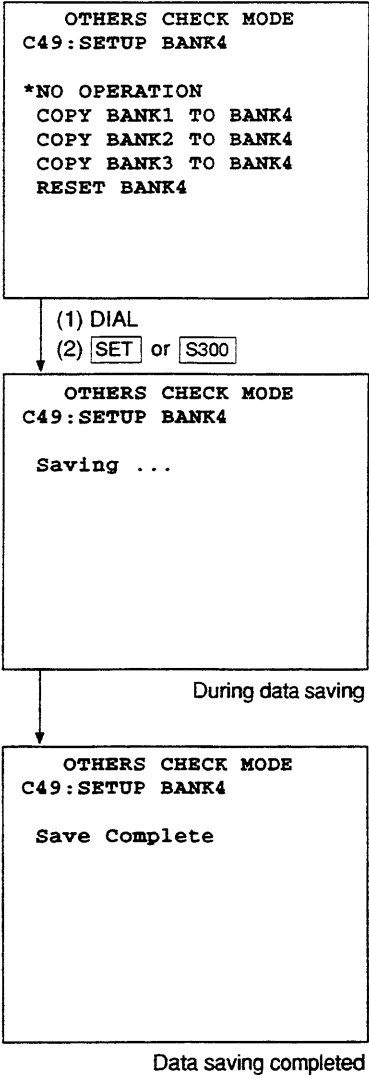

This mode copies into the setup menu BANK-4 from BANK-1, 2, or 3, or resets it to the factory data.

The C49 mode is applied on the unit in which the version No. of both SYS1 ROM (IC12) and SYS2 ROM (IC54) on the SS board are 3.10 or higher.

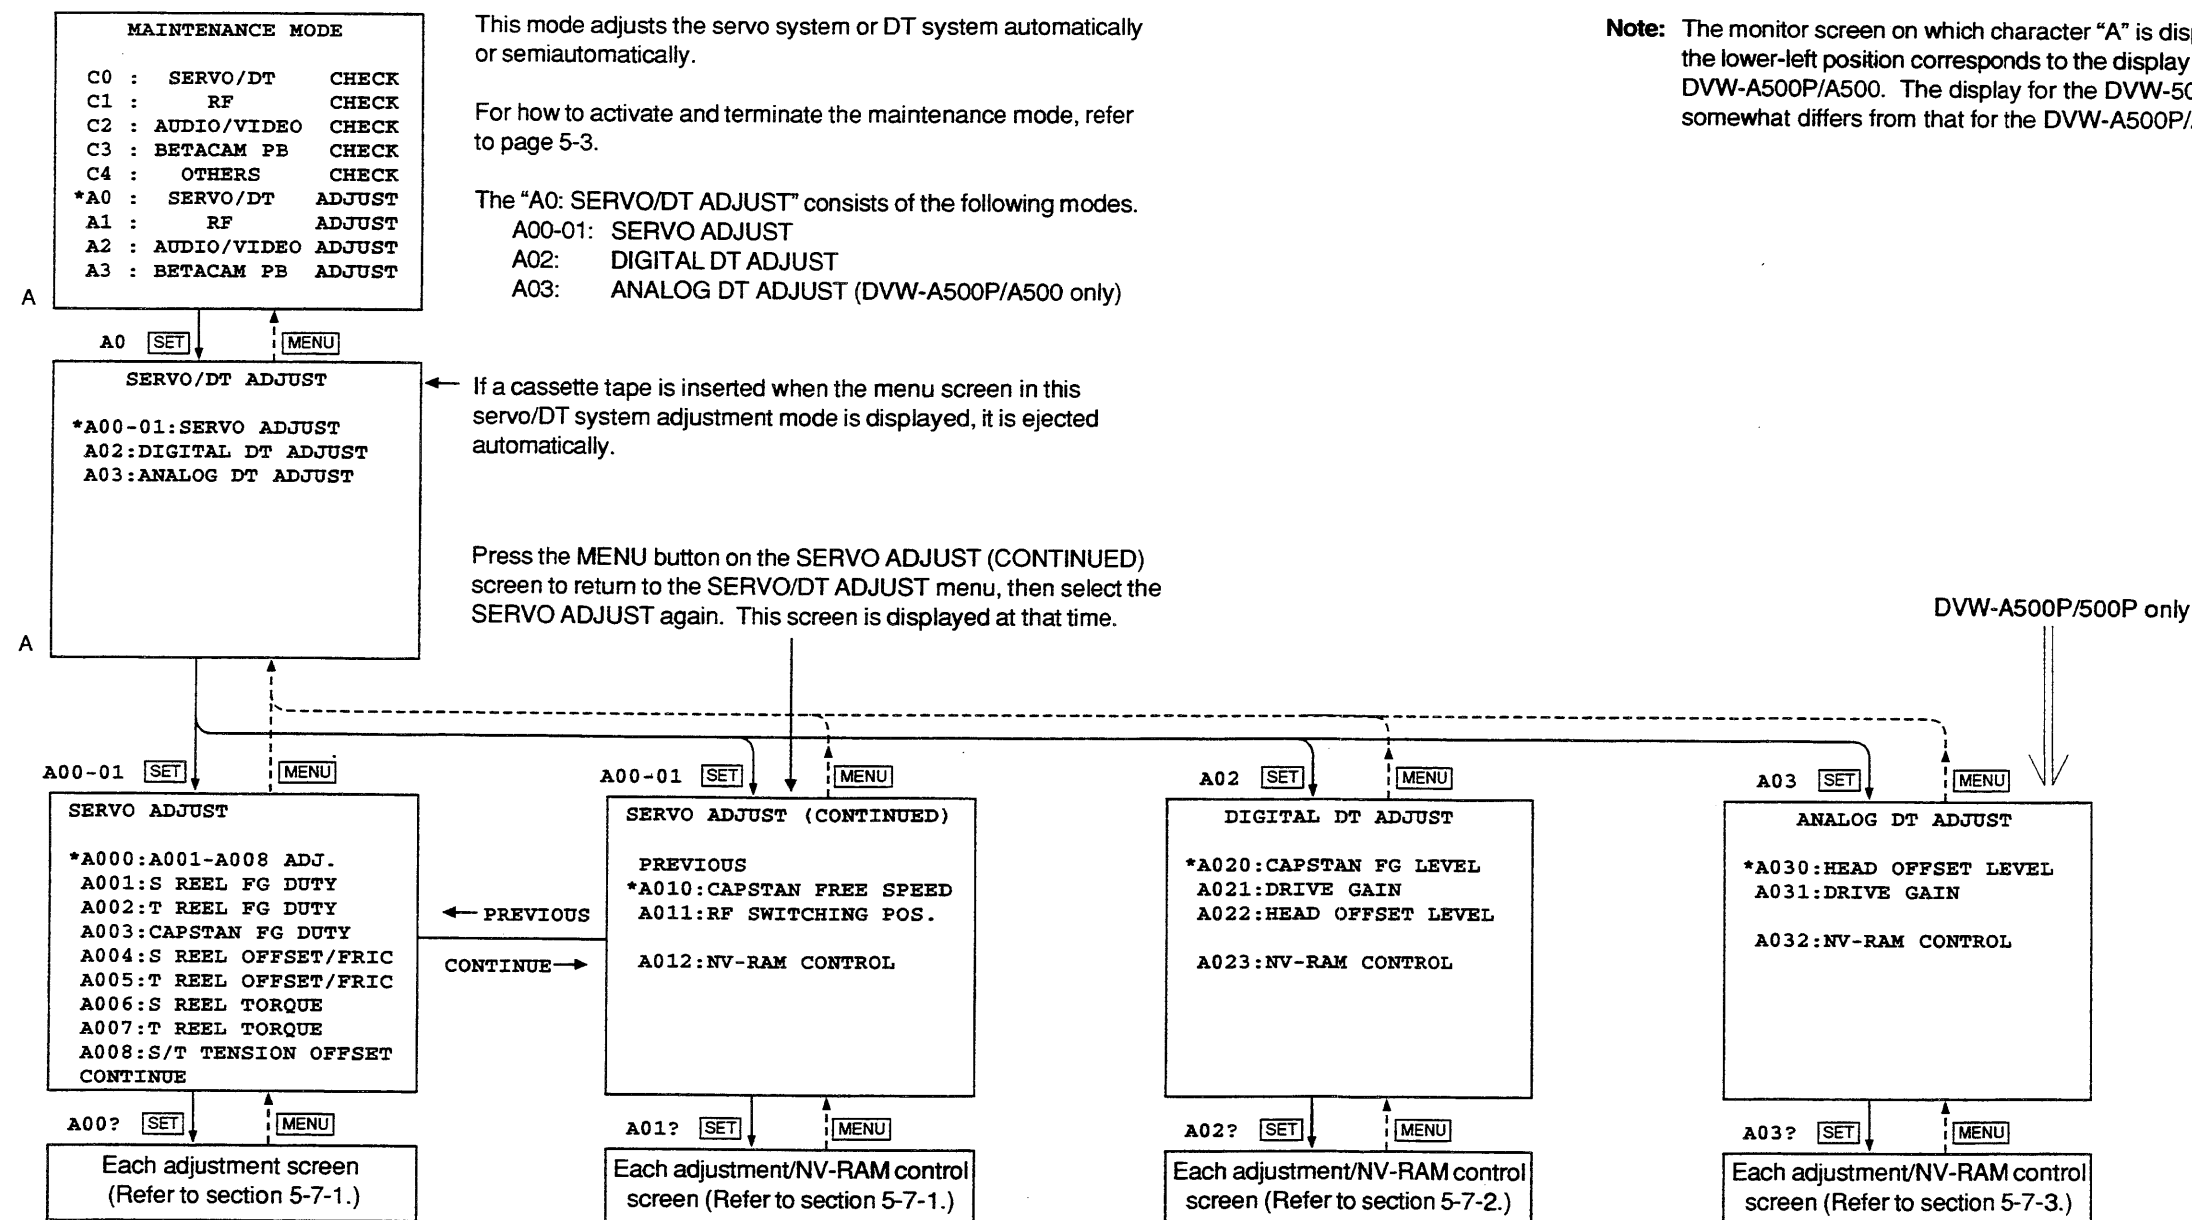

- (1) Using a serch dial (JOG mode), set the “*” mark as follows;
Set it to “COPY BANK1 TO BANK4” when the BANK-1 data is copied into the BANK-4.
Set it to “COPY BANK2 TO BANK4” when the BANK-2 data is copied into the BANK-4.
Set it to “COPY BANK3 TO BANK4” when the BANK-3 data is copied into the BANK-4.
Set it into “RESET BANK4” when the BANK-4 data resets to the factory data.

- (2) Press the SET button (or switch S300 on the SS board) to initiate the data transfer.

- (3) After data transfer is completed, the “Save Complete” message is displayed on the monitor screen.

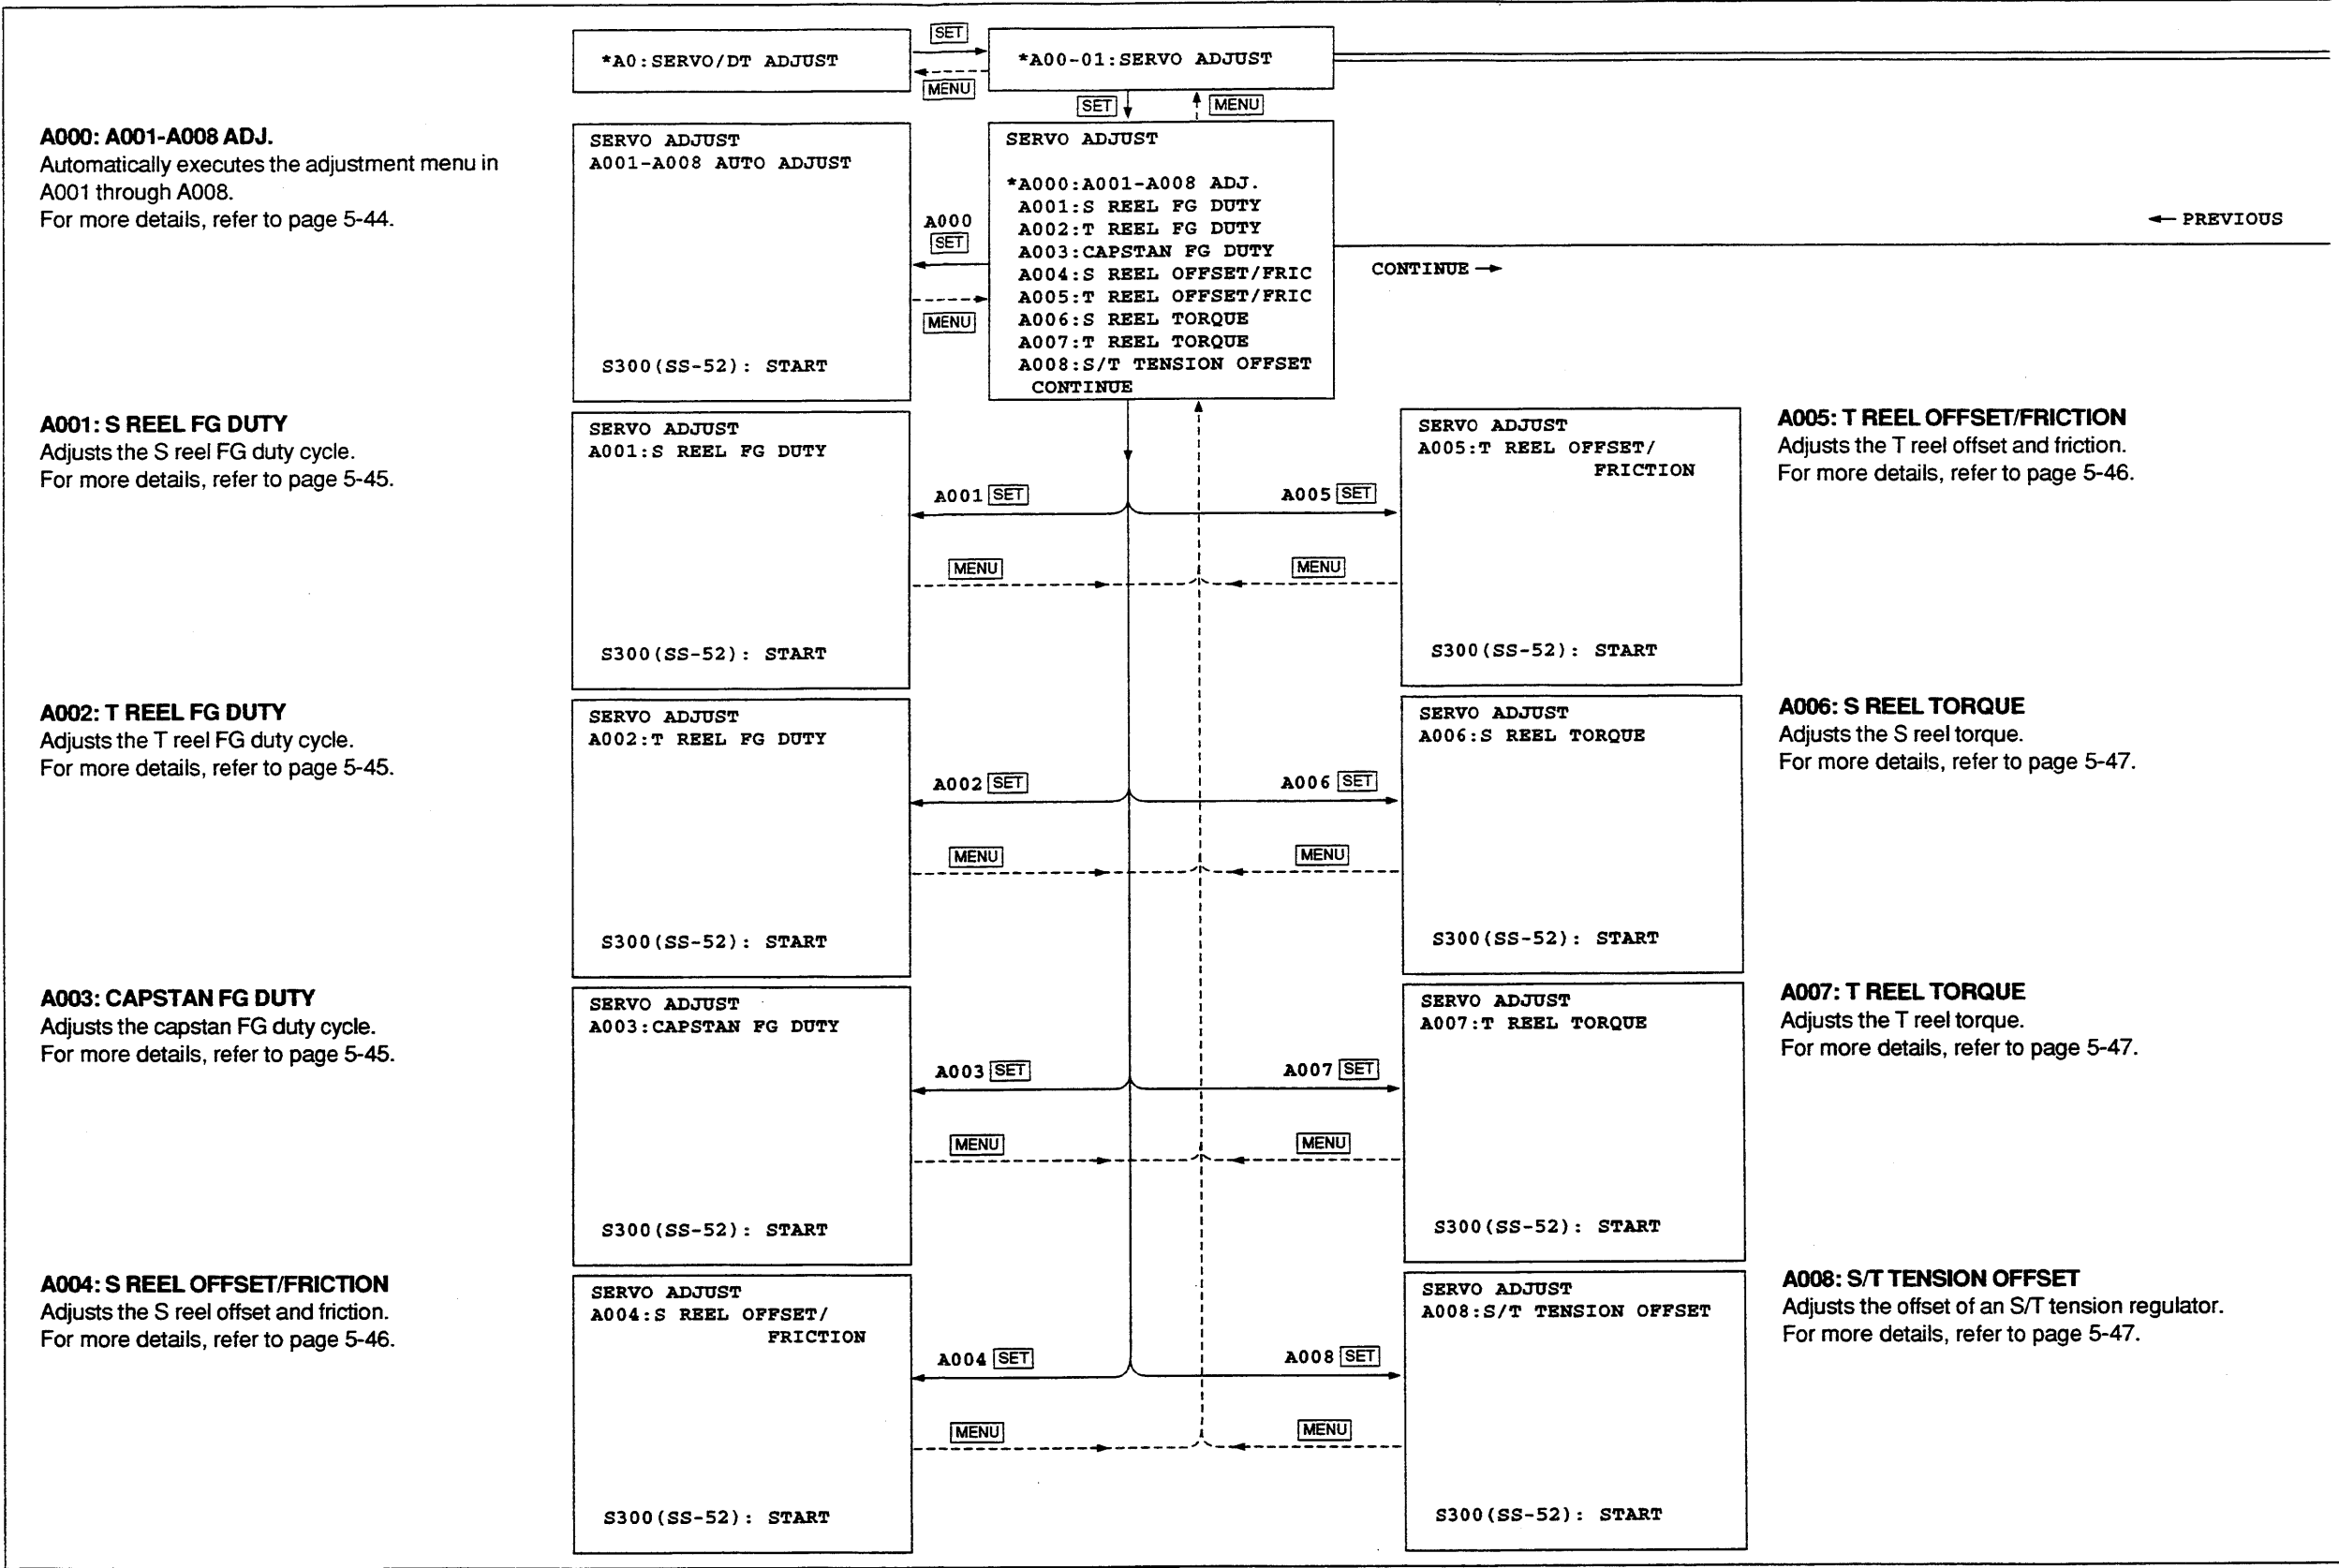

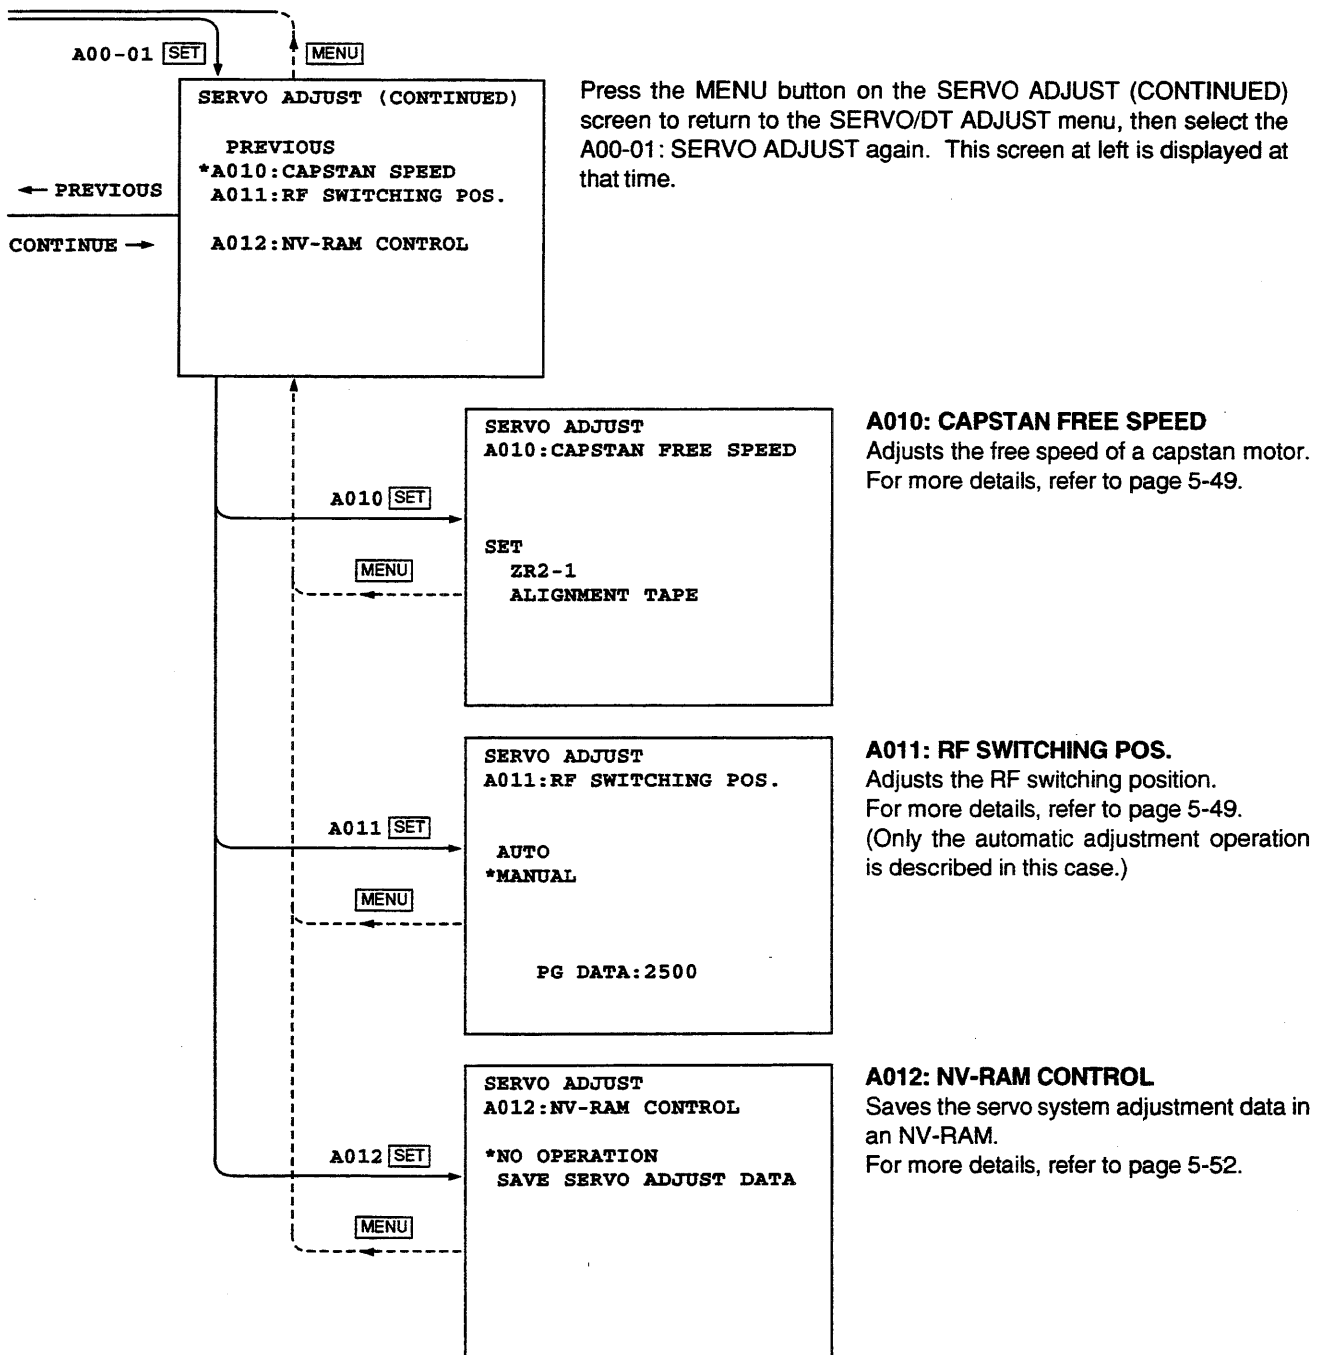

5-7. SERVO/DT SYSTEM ADJUSTMENT MODE (A0: SERVO/DT ADJUST)

5-7-1. Servo System Adjustment Mode (A00-01: SERVO ADJUST)

This section describes the "A00-01: SERVO ADJUST" mode.

a) A000: A001-A008 ADJ.

This mode executes the adjustment menus below automatically and continuously.

A001: S REEL FG DUTY
 A002: T REEL FG DUTY
 A003: CAPSTAN FG DUTY
 A004: S REEL OFFSET/FRICTION
 A005: T REEL OFFSET/FRICTION
 A006: S REEL TORQUE
 A007: T REEL TORQUE
 A008: S/T TENSION OFFSET

- (1) Press the SET button (or switch S300 on the SS board) to initiate the adjustment.

The "A001: S REEL FG DUTY" adjustment is performed first.
 The "ADJUSTING....." message is displayed during adjustment.

As the adjustment progresses, the display in the fifth line (※) changes.

- (2) If no abnormality is found after all the adjustments are completed, the "ADJUST COMPLETE" message is displayed on the monitor screen.

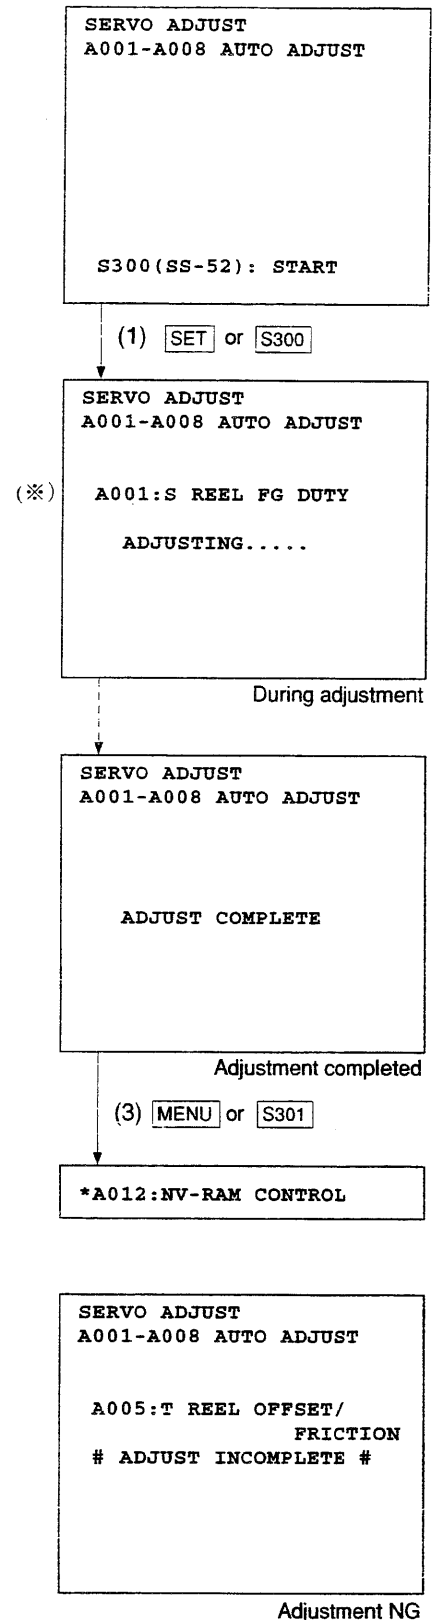

- (3) Press the MENU button (or switch S301 on the SS board) to return to the SERVO ADJUST menu screen.

- (4) To save the adjustment data in an NV-RAM, execute the "A012: NV-RAM CONTROL" mode.

In case of NG; (The screen at right is one example.)

When the "ADJUST INCOMPLETE" message is displayed on the monitor screen.

Refer to the "In case of NG" in each adjustment menu.

- b) **A001: S REEL FG DUTY**
A002: T REEL FG DUTY
A003: CAPSTAN FG DUTY

A001: Adjusts the S reel FG duty cycle.

A002: Adjusts the T reel FG duty cycle.

A003: Adjusts the capstan FG duty cycle.

These operation methods are the same as one another. The monitor screen at right is displayed for "A001: S REEL FG DUTY".

- (1) Press the SET button (or switch S300 on the SS board) to initiate the adjustment.

During adjustment, the "ADJUSTING....." message is displayed on the monitor screen.

- (2) After adjustment is completed, the "ADJUST COMPLETE" message is displayed on the monitor screen.

- (3) Press the MENU button (or switch S301 on the SS board) to return to the SERVO ADJUST menu screen.

- (4) To save the adjustment data in an NV-RAM, execute the "A012: NV-RAM CONTROL" mode.

In case of NG;

When the "ADJUST INCOMPLETE" message is displayed on the monitor screen, perform the following checks.

- For "A001: S REEL FG DUTY", check the S reel FG amplifier circuit and S reel motor driver circuit on the DR-307/200 board.
- For "A002: T REEL FG DUTY", check the T reel FG amplifier circuit and T reel motor driver circuit on the DR-307/200 board.
- For "A003: CAPSTAN FG DUTY", check the capstan FG amplifier circuit and capstan motor driver circuit on the DR-307/200 board.

(1) **SET** or **S300**

During adjustment

Adjustment completed

(3) **MENU** or **S301**

Adjustment NG

c) **A004: S REEL OFFSET/FRICTION**
A005: T REEL OFFSET/FRICTION

A004: Adjusts the S reel offset and friction.

A005: Adjusts the T reel offset and friction.

These operation methods are the same as each other. The monitor screen at right is displayed for "A004: S REEL OFFSET/FRICTION".

- (1) Press the SET button (or switch S300 on the SS board) to initiate the adjustment.

During adjustment, the "ADJUSTING....." message is displayed on the monitor screen.

- (2) After adjustment is completed, the "ADJUST COMPLETE" message is displayed on the monitor screen.

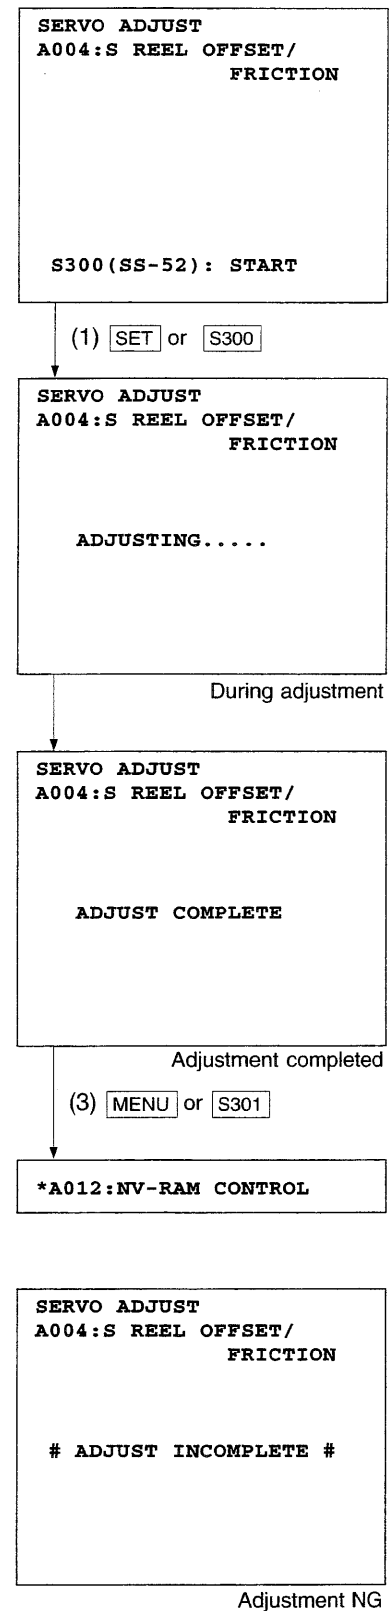

- (3) Press the MENU button (or switch S301 on the SS board) to return to the SERVO ADJUST menu screen.

- (4) To save the adjustment data in an NV-RAM, execute the "A012: NV-RAM CONTROL" mode.

In case of NG;

When the "ADJUST INCOMPLETE" message is displayed on the monitor screen, perform the following adjustments and checks.

- For "A004: S REEL OFFSET/FRICTION", adjust the S reel FG duty cycle (A001: S REEL FG DUTY) again and check the S reel motor driver circuit on the DR-307/200 board.
- For "A005: T REEL OFFSET/FRICTION", adjust the T reel FG duty cycle (A002: T REEL FG DUTY) again and check the T reel motor driver circuit on the DR-307/200 board.

**d) A006: S REEL TORQUE
A007: T REEL TORQUE**

A006: Adjusts the S reel torque.

A007: Adjusts the T reel torque.

These operation methods are the same as each other. The monitor screen at right is displayed for "A006: S REEL TORQUE".

- (1) Press the SET button (or switch S300 on the SS board) to initiate the adjustment.

During adjustment, the "ADJUSTING....." message is displayed on the monitor screen.

- (2) After adjustment is completed, the "ADJUST COMPLETE" message is displayed on the monitor screen.

- (3) Press the MENU button (or switch S301 on the SS board) to return to the SERVO ADJUST menu screen.

- (4) To save the adjustment data in an NV-RAM, execute the "A012: NV-RAM CONTROL" mode.

In case of NG;

When the "ADJUST INCOMPLETE" message is displayed on the monitor screen, perform the following adjustments and checks.

- For "A006: S REEL TORQUE", adjust the S reel FG duty cycle (A001: S REEL FG DUTY) again and check the S reel motor driver circuit on the DR-307/200 board.
- For "A007: T REEL TORQUE", adjust the T reel FG duty cycle (A002: T REEL FG DUTY) again and check the T reel motor driver circuit on the DR-307/200 board.

e) A008: S/T TENSION OFFSET

This mode adjusts the offset of an S/T tension regulator.

- (1) Press the SET button (or switch S300 on the SS board) to initiate the adjustment.

During adjustment, the “ADJUSTING.....” message is displayed on the monitor screen.

- (2) After adjustment is completed, the “ADJUST COMPLETE” message is displayed on the monitor screen.

- (3) Press the MENU button (or switch S301 on the SS board) to return to the SERVO ADJUST menu screen.

- (4) To save the adjustment data in an NV-RAM, execute the “A012: NV-RAM CONTROL” mode.

In case of NG;

When the “ADJUST INCOMPLETE” message is displayed on the monitor screen.

Check the S tension detector circuit (IC40) or T tension detector circuit (IC32) on the DR-307/200 board.

f) A010: CAPSTAN FREE SPEED

This mode adjusts the free speed of a capstan.

- (1) When alignment tape ZR2-1P/1 is inserted into this unit, this adjustment is initiated automatically.

ZR2-1P; for DVW-A500P/500P
ZR2-1 ; for DVW-A500/500

During adjustment, the "ADJUSTING....." message is displayed on the monitor screen.

Note: Be sure to use alignment tape ZR2-1P/1. If not, the adjustment is not performed correctly even if the "ADJUST COMPLETE" message is displayed after adjustment is completed.

- (2) After adjustment is completed, the "ADJUST COMPLETE" message is displayed on the monitor screen.

The alignment tape is ejected automatically.

- (3) Press the MENU button (or switch S301 on the SS board) to return to the SERVO ADJUST menu screen.

- (4) To save the adjustment data in an NV-RAM, execute the "A012: NV-RAM CONTROL" mode.

In case of NG;

When the "ADJUST INCOMPLETE" message is displayed on the monitor screen.

Confirm that the playback tape is alignment tape ZR2-1P/1.

Then, check the capstan FG amplifier circuit, capstan motor driver circuit, and CTL amplifier circuit on the DR-307/200 board.

(1) Insert alignment tape

During adjustment

Adjustment completed

(3) MENU or S301

Adjustment NG

g) A011: RF SWITCHING POS.

This mode adjusts the RF switching position.

This step describes the automatic adjustment operation. (The PG data displayed in this case is a standard value.)

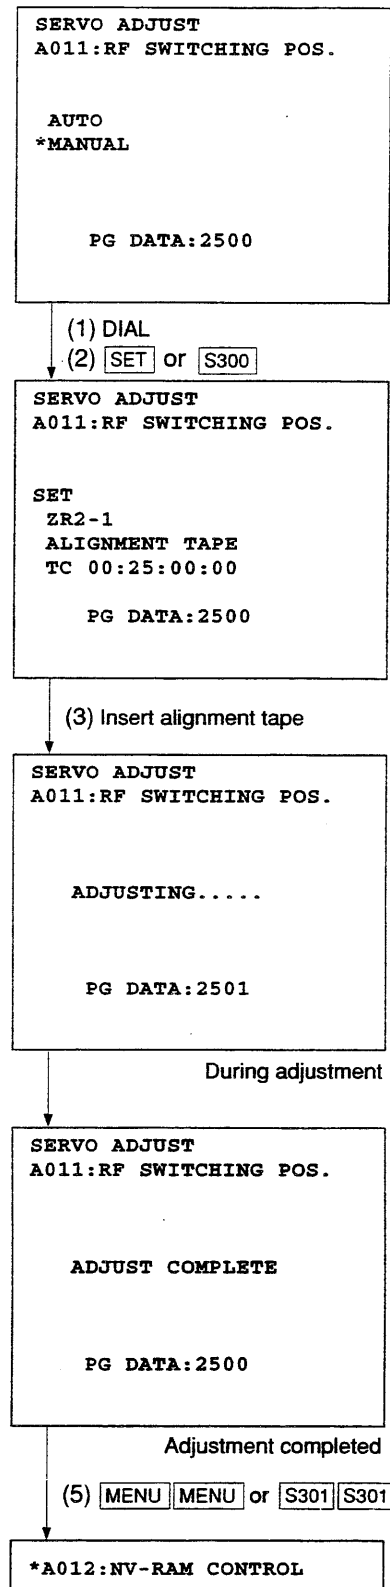

To perform this adjustment, alignment tape ZR2-1P/1 on which the beginning of the time code is beforehand located in 00:25:00:00 is required.

- (1) Set the "*" mark to "AUTO" using a search dial (JOG mode).
- (2) Press the SET button (or switch S300 on the SS board).
The monitor screen changes as shown at right.
- (3) When alignment tape ZR2-1P/1 is inserted into this unit, this adjustment is initiated automatically.

 ZR2-1P; for DVW-A500P/500P
 ZR2-1 ; for DVW-A500/500

 During adjustment, the "ADJUSTING....." message is displayed on the monitor screen.

Note: Be sure to use alignment tape ZR2-1P/1. If not, the adjustment is not performed correctly even if the "ADJUST COMPLETE" message is displayed after adjustment is completed.
- (4) After adjustment is completed, the "ADJUST COMPLETE" message is displayed on the monitor screen.
The alignment tape is then ejected automatically.
- (5) Press the MENU button (or switch S301 on the SS board) two times to return to the SERVO ADJUST menu screen.
- (6) To save the adjustment data in an NV-RAM, execute the "A012: NV-RAM CONTROL" mode.

In case of NG; (The screen at right is one example.)

- When the "SYNC PULSE TROUBLE" message is displayed on the monitor screen.

- (1) Confirm that the playback tape is alignment tape ZR2-1P/1.
- (2) Confirm that the SYNC pulse exists at the test terminal below on the SS board.

TP802: SYNC PLS

No SYNC pulse exists: Perform the steps (3) and (4).

A SYNC pulse exist: Check the SS board.

- (3) Perform the "C050: DT DRIVER CHECK" and "C051: SG LOOP CHECK" in the digital DT system.
- (4) Confirm that a segment signal exists at pins 41A and 41B of connector CN123 on the SS board.
CN123-41A: DT SEG 0
CN123-41B: DT SEG 1

No segment signal exists: Check the DPR-36 board.

A segment signal exists: Check the SS board.

- When the "SAT TROUBLE" message is displayed.
Perform the "C041: SELFDIAG MODE" of SAT CHECK in the servo system check mode.

```
SERVO ADJUST
A011:RF SWITCHING POS.

# ADJUST INCOMPLETE #
# SYNC PULSE TROUBLE#
```

PG DATA:2500

Adjustment NG

h) A012: NV-RAM CONTROL

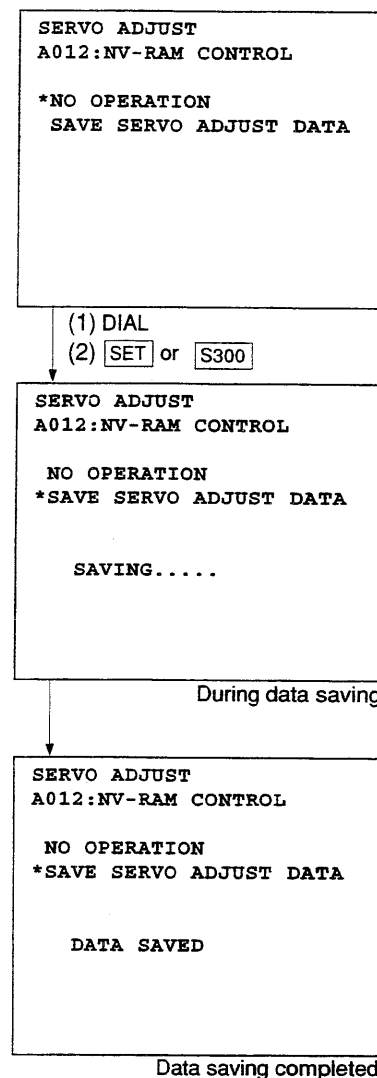

This mode saves the servo system adjustment data in an NV-RAM.

- (1) Set the "*" mark to "SAVE SERVO ADJUST DATA" using a search dial (JOG mode).

- (2) Press the SET button (or switch S300 on the SS board) to initiate the data transfer.

The "SAVING....." message is then displayed on the monitor screen.

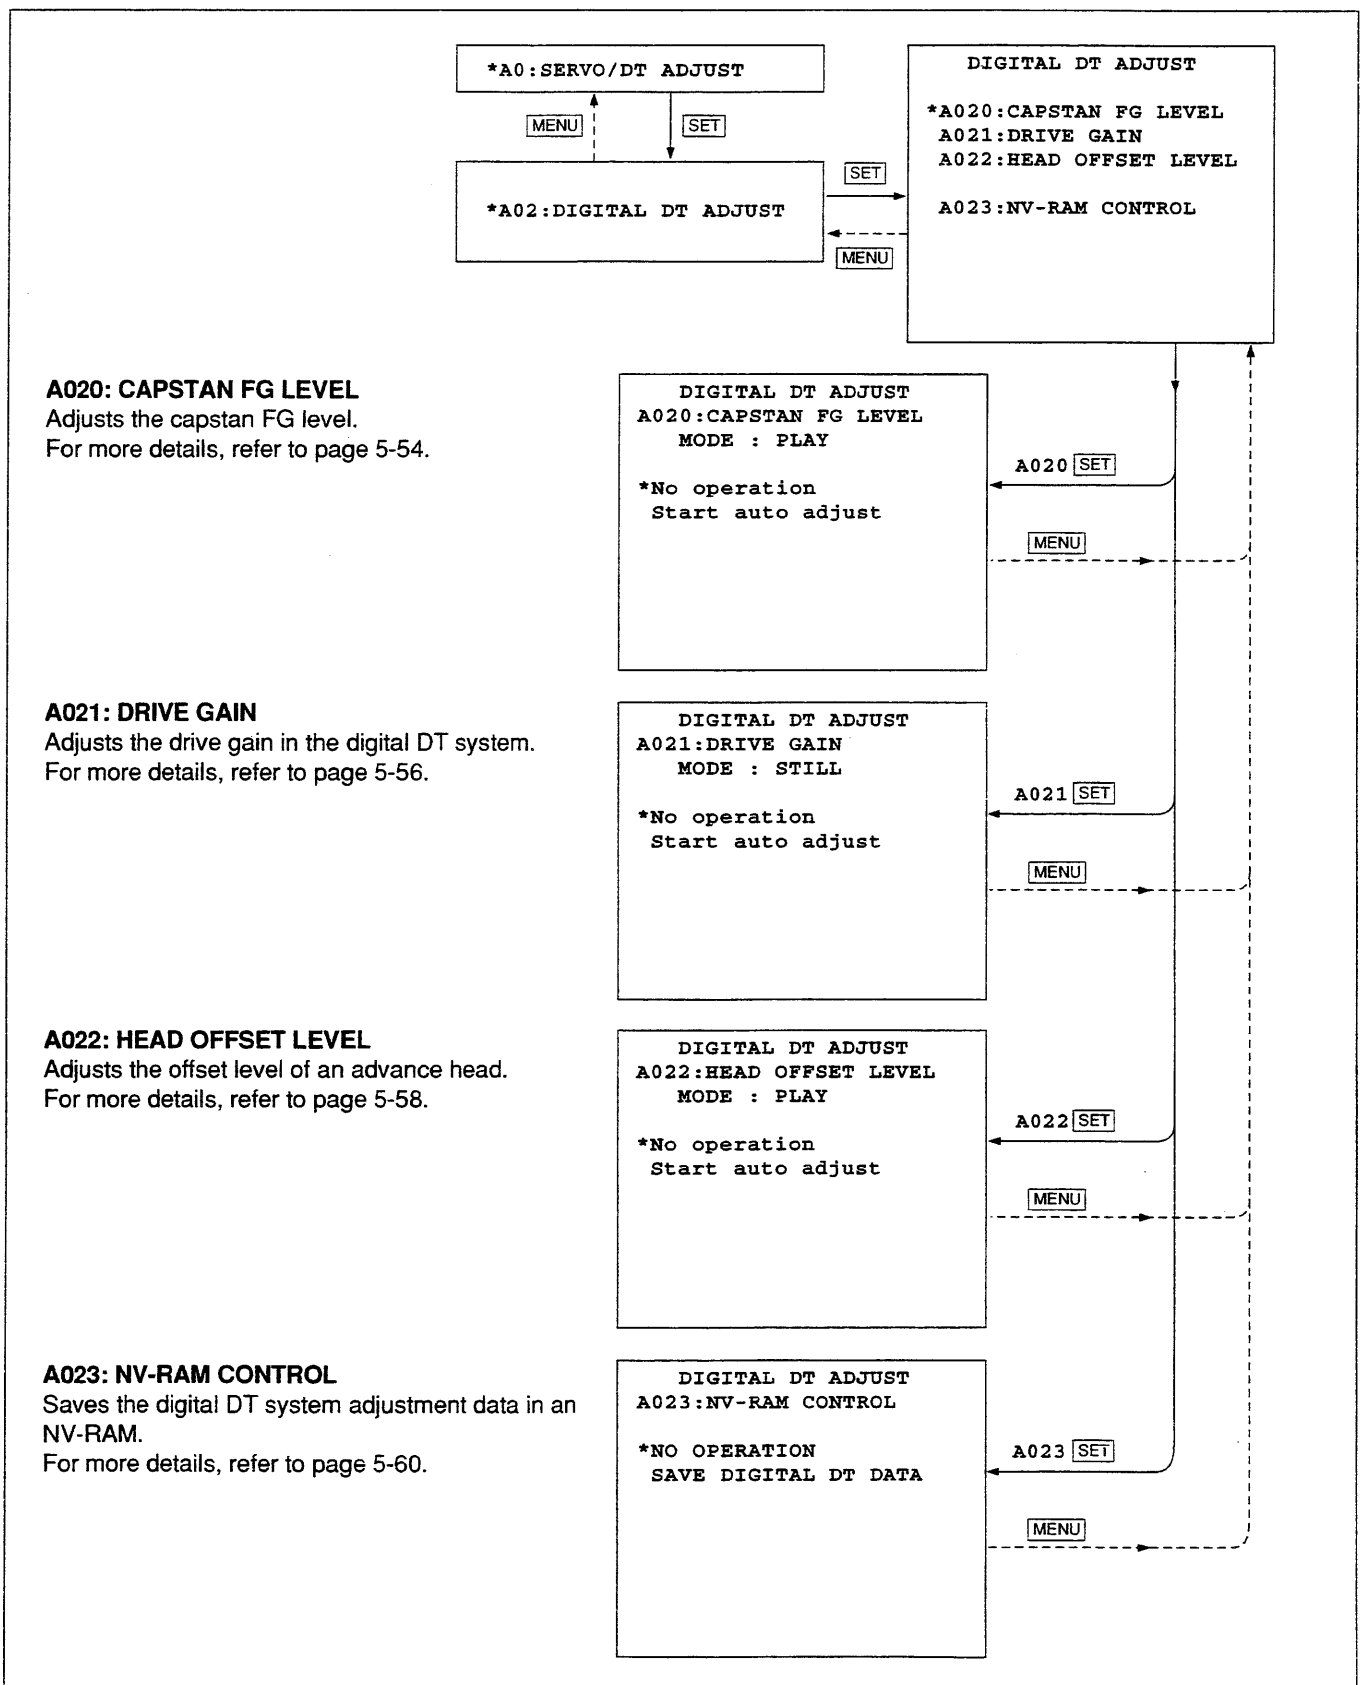

- (3) After data transfer is completed, the "DATA SAVED" message is displayed on the monitor screen.

Note: If the power of this unit is turned off without saving the adjustment data in an NV-RAM after adjustment is completed, the adjustment data in the servo system returns to the preadjustment state.

5-7-2. Digital DT System Adjustment Mode (A02: DIGITAL DT ADJUST)

This section describes the "A02: DIGITAL DT ADJUST" mode.

a) A020: CAPSTAN FG LEVEL

This mode adjusts the capstan FG level.

- (1) Insert alignment tape ZR5-1P/1 into this unit.

ZR5-1P; for DVW-A500P/500P
ZR5-1 ; for DVW-A500/500

- (2) Set the "*" mark to "Start auto adjust" using a search dial (JOG mode).
- (3) Press the SET button (or switch S300 on the SS board).
(If the unit has already entered the PLAY mode, the adjustment is initiated.)
- (4) The "Push PLAY button" message is displayed on the monitor screen. Press the PLAY button to initiate the adjustment.

During adjustment, the "ADJUSTING....." message is displayed on the monitor screen.

- (5) After adjustment is completed, the "ADJUST COMPLETE" message is displayed on the monitor screen.

- (6) Press the MENU button (or switch S301 on the SS board) to return to the DIGITAL DT ADJUST menu screen.

- (7) To save the adjustment data in an NV-RAM, execute the "A023: NV-RAM CONTROL" mode.

How to eject the cassette tape

Return to the menu in the servo/DT system adjustment mode. The cassette tape is then ejected automatically.

In case of NG;

When the "ADJUST COMPLETE" message is not displayed on the monitor screen.

Check the capstan motor and capstan FG amplifier (on the DR-307/200 board).

```
DIGITAL DT ADJUST
A020:CAPSTAN FG LEVEL
MODE : PLAY
```

```
No operation
*Start auto adjust
```

```
# ADJUST INCOMPLETE #
```

Adjustment NG

b) A021: DRIVE GAIN

This mode adjusts the drive gain of the bimorph head.

- (1) Insert alignment tape ZR5-1P/1 into this unit.

ZR5-1P; for DVW-A500P/500P

ZR5-1 ; for DVW-A500/500

- (2) Set the "*" mark to "Start auto adjust" using a search dial (JOG mode).
- (3) Press the SET button (or switch S300 on the SS board).
(If the unit has already entered the STILL mode, the adjustment is initiated.)
- (4) The "Push JOG button" message is displayed on the monitor screen.
Press the JOG button. The unit then enters the STILL mode to initiate the adjustment.

During adjustment, the "ADJUSTING....." message is displayed on the monitor screen.

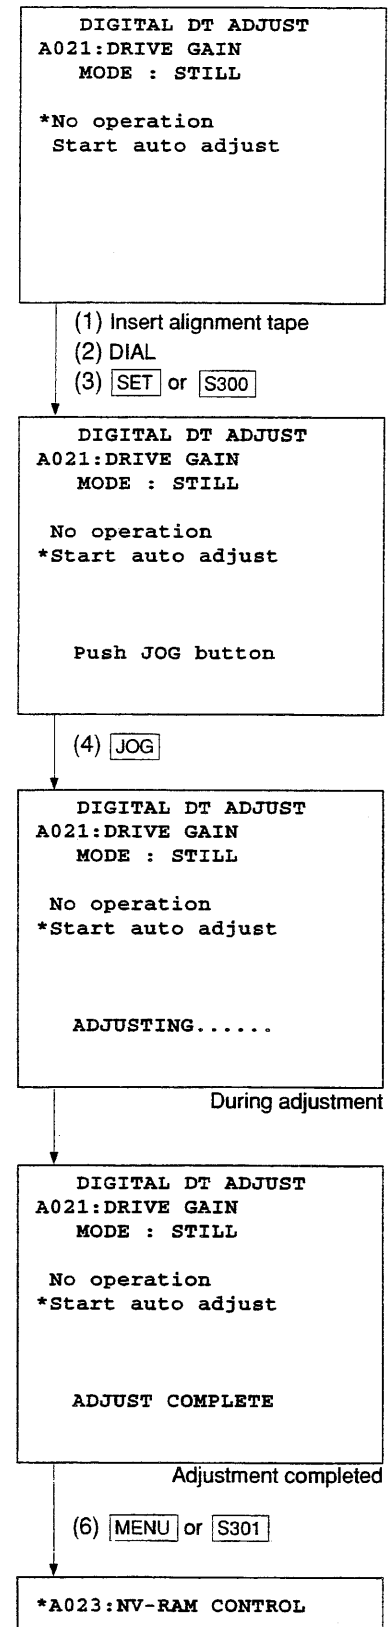

- (5) After adjustment is completed, the "ADJUST COMPLETE" message is displayed on the monitor screen.

- (6) Press the MENU button (or switch S301 on the SS board) to return to the DIGITAL DT ADJUST menu screen.

- (7) To save the adjustment data in an NV-RAM, execute the "A023: NV-RAM CONTROL" mode.

How to eject the cassette tape

Return to the menu in the servo/DT system adjustment mode. The cassette tape is then ejected automatically.

In case of NG; (The screen at right is one example.)

When the "ADJUST COMPLETE" message is not displayed on the monitor screen, perform the following checks and confirmation.

- (1) Perform the "C050: DT DRIVER CHECK" and "C051: SG LOOP CHECK" in the digital DT system.
- (2) Confirm that an RF envelope signal exists at the test terminals below on the SS board.
 TP2501: ENV B/D
 TP2502: ENV A/C

No RF envelope signal exists: Check the EQ board.

An RF envelope signal exists: Check the SS board.

Adjustment NG

c) A022: HEAD OFFSET LEVEL

This mode adjusts the offset level of an advance head.

- (1) Insert alignment tape ZR5-1P/1 into this unit.

ZR5-1P; for DVW-A500P/500P
ZR5-1 ; for DVW-A500/500

- (2) Set the "*" mark to "Start auto adjust" using a search dial (JOG mode).

- (3) Press the SET button (or switch S300 on the SS board).
(If the unit has already entered the PLAY mode, the adjustment is initiated.)

- (4) The "Push PLAY button" message is displayed on the monitor screen.
Press the PLAY button to initiate the adjustment.

During adjustment, the "ADJUSTING....." message is displayed on the monitor screen.

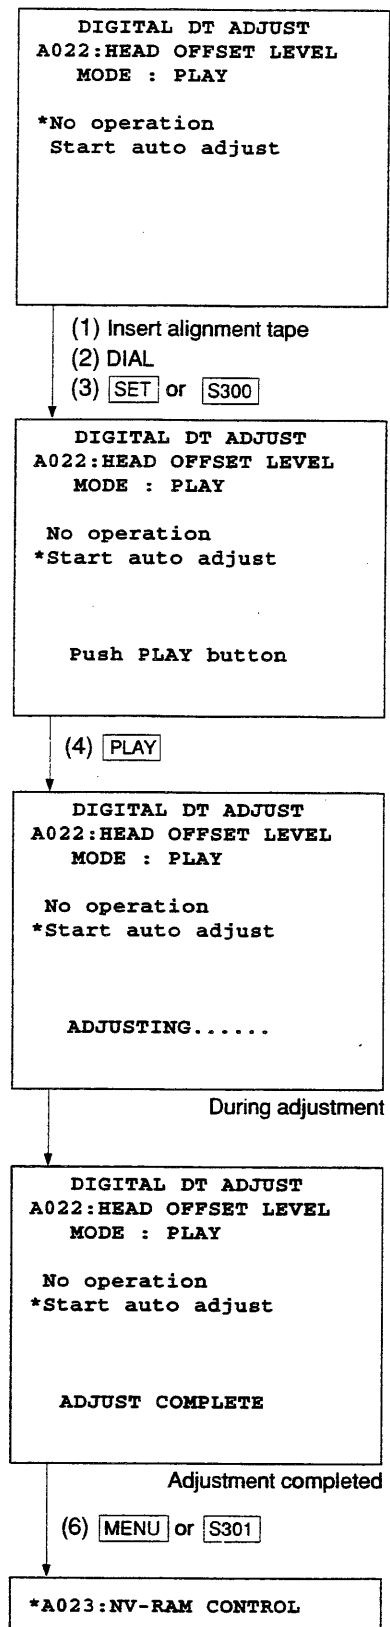

- (5) After adjustment is completed, the "ADJUST COMPLETE" message is displayed on the monitor screen.

- (6) Press the MENU button (or switch S301 on the SS board) to return to the DIGITAL DT ADJUST menu screen.

- (7) To save the adjustment data in an NV-RAM, execute the "A023: NV-RAM CONTROL" mode.

How to eject the cassette tape

Return to the menu in the servo/DT system adjustment mode. The cassette tape is then ejected automatically.

In case of NG; (The screen at right is one example.)

When the "ADJUST COMPLETE" message is not displayed on the monitor screen, perform the following checks and confirmation.

- (1) Perform the "C050: DT DRIVER CHECK" and "C051: SG LOOP CHECK" in the digital DT system.
- (2) Confirm that a segment signal exists at pins 41A and 41B of connector CN123 on the SS board.
 - CN123-41A: DT SEG 0
 - CN123-41B: DT SEG 1

No segment signal exists: Check the DPR-36 board.

A segment signal exists: Check the SS board.

Adjustment NG

d) A023: NV-RAM CONTROL

This mode saves the digital DT system adjustment data in an NV-RAM.

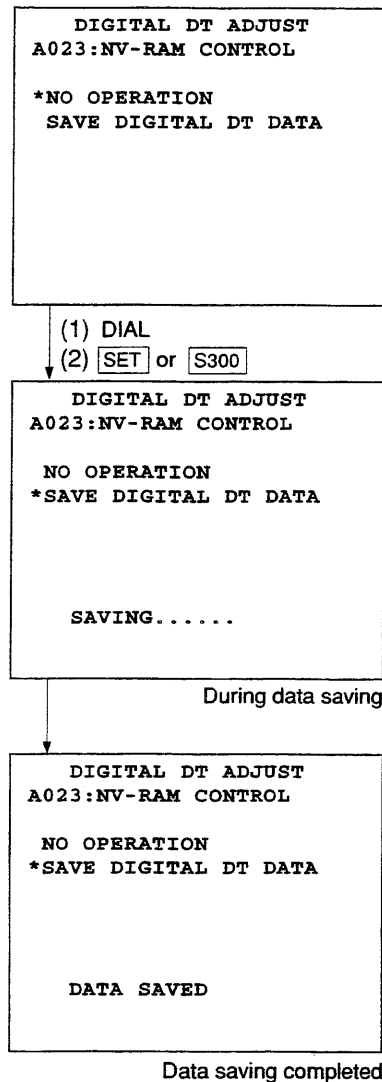

(1) Set the "*" mark to "SAVE DIGITAL DT DATA" using a search dial (JOG mode).

(2) Press the SET button (or switch S300 on the SS board) to initiate the data transfer.

The "SAVING....." message is then displayed on the monitor screen.

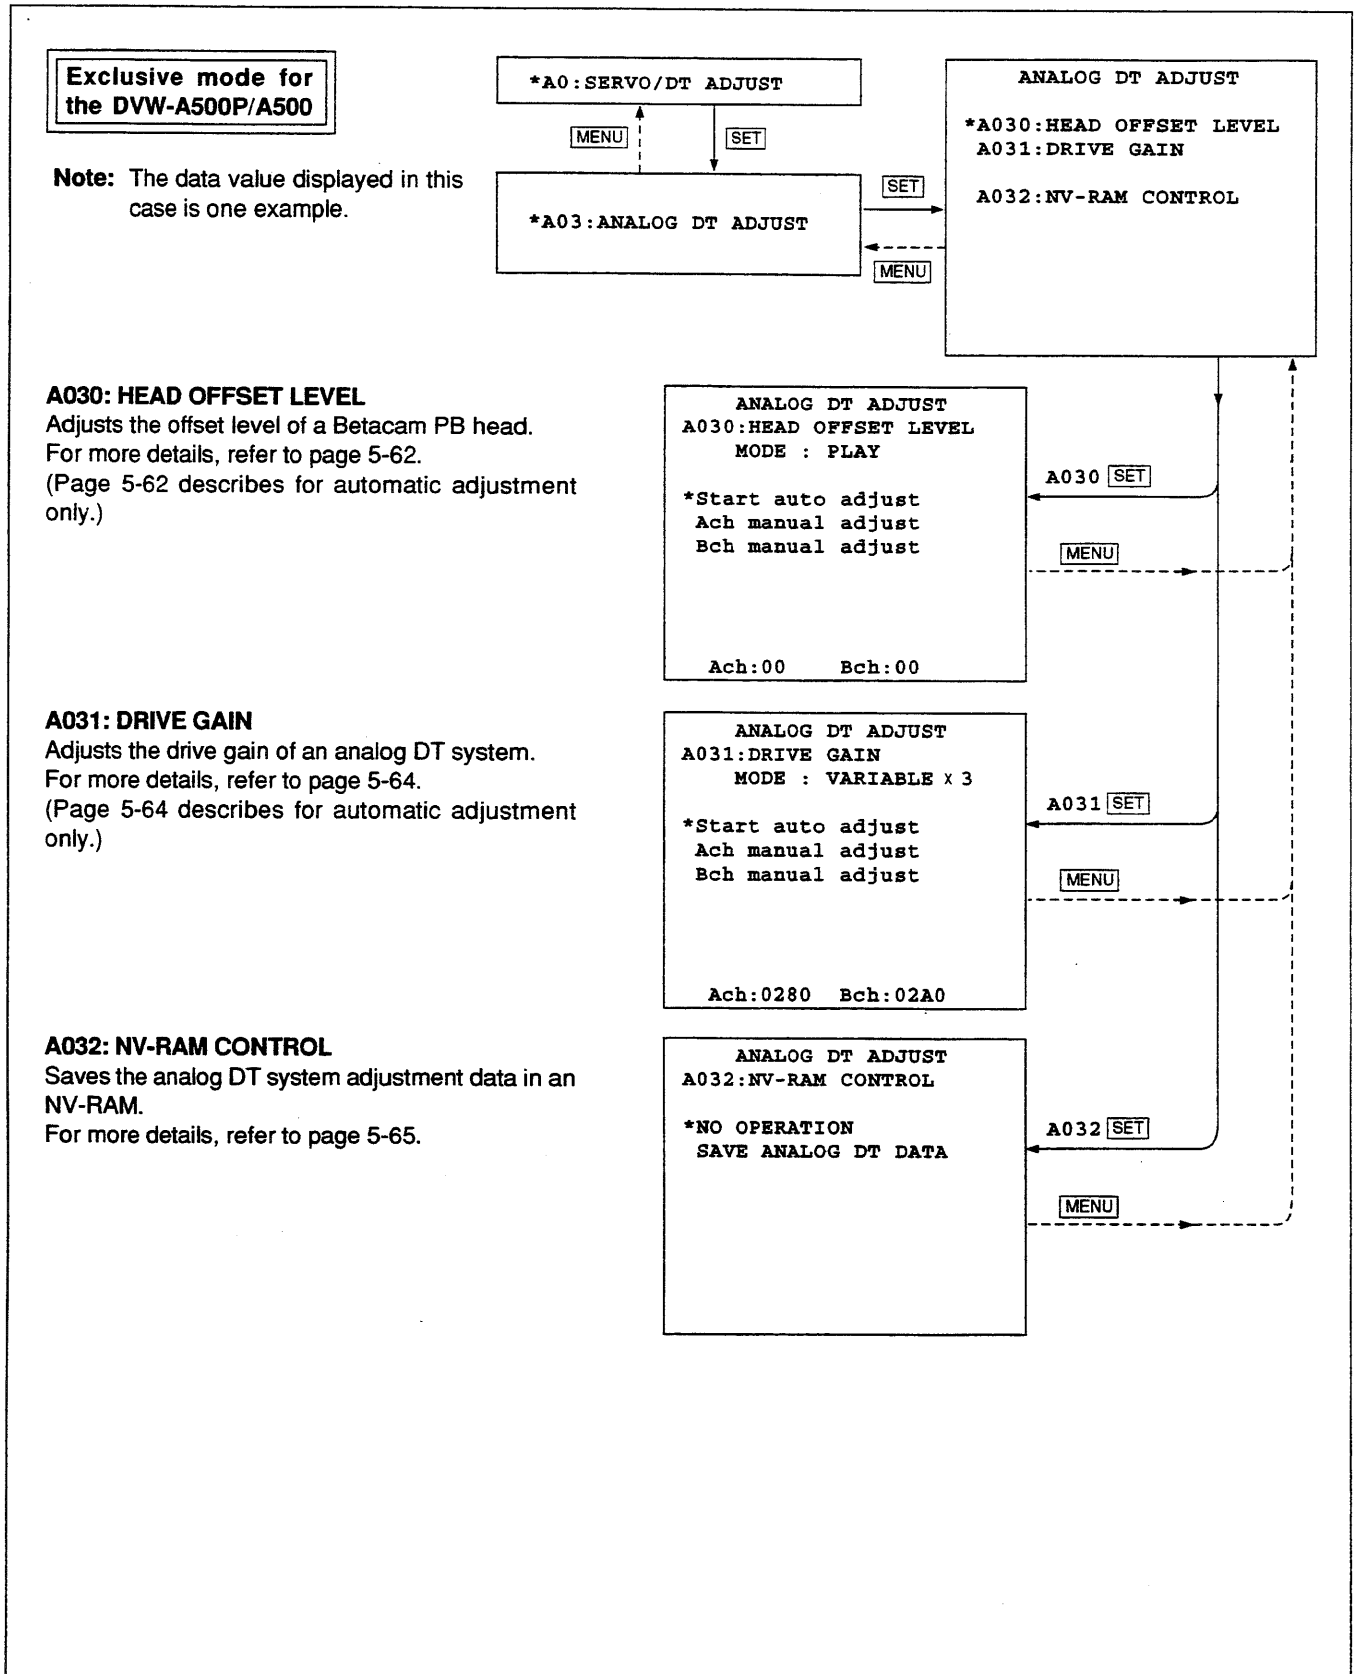

(3) After data transfer is completed, the "DATA SAVED" message is displayed on the monitor screen.

Note: If the power of this unit is turned off without saving the adjustment data in an NV-RAM after adjustment is completed, the adjustment data in the digital DT system returns to the preadjustment state.

5-7-3. Analog DT System Adjustment Mode (For DVW-A500P/A500) (A03: ANALOG DT ADJUST)

This section describes the "A03: ANALOG DT ADJUST" mode.

a) A030: HEAD OFFSET LEVEL

This mode adjusts the offset level of a Betacam PB head.
This step describes the automatic adjustment operation.
(The data value displayed in this case is a standard value.)

- (1) Insert alignment tape CR5-1BPS/1B or CR5-2APS/2A whose beginning is beforehand located in the color bars signal portion into this unit.

CR5-1B PS: TC 00:14:00:00	} for DVW-A500P
CR5-2A PS: TC 00:00:00:00	
CR5-1B : TC 00:14:00:00	} for DVW-A500
CR5-2A : TC 00:00:00:00	
- (2) Set the "*" mark to "Start auto adjust" using a search dial (JOG mode).
- (3) Press the SET button (or switch S300 on the SS board).
(If the unit has already entered the PLAY mode, the adjustment is initiated.)
- (4) The "Push PLAY button" message is displayed on the monitor screen.
Press the PLAY button to initiate the adjustment.

During adjustment, the "ADJUSTING....." message is displayed on the monitor screen.
However, the displayed data value does not change during adjustment.

- (5) After adjustment is completed, the "ADJUST COMPLETE" message is displayed on the monitor screen.
The data value changes to the data value during this adjustment.
- (6) Press the MENU button (or switch S301 on the SS board) to return to the ANALOG DT ADJUST menu screen.
- (7) To save the adjustment data in an NV-RAM, execute the "A032: NV-RAM CONTROL" mode.

How to eject the cassette tape

Return to the menu in the servo/DT system adjustment mode. The cassette tape is then ejected automatically.

In case of NG; (The screen at right is one example.)

When the "ADJUST COMPLETE" message is not displayed on the monitor screen, perform the following check and confirmation.

- (1) Perform the "C060: SG LOOP CHECK" in the analog DT system.
- (2) Confirm that an RF envelope signal exists at the test terminal below on the SS board.

TP2100: Y RF ENVELOPE

No RF envelope signal exists: Check the DM-89 board.

An RF envelope signal exists: Check the SS board.

```

Adjustment NG

b) A031: DRIVE GAIN

This mode adjusts the drive gain of an analog DT system.
 This step describes the automatic adjustment operation.
 (The data value displayed in this case is a standard value.)

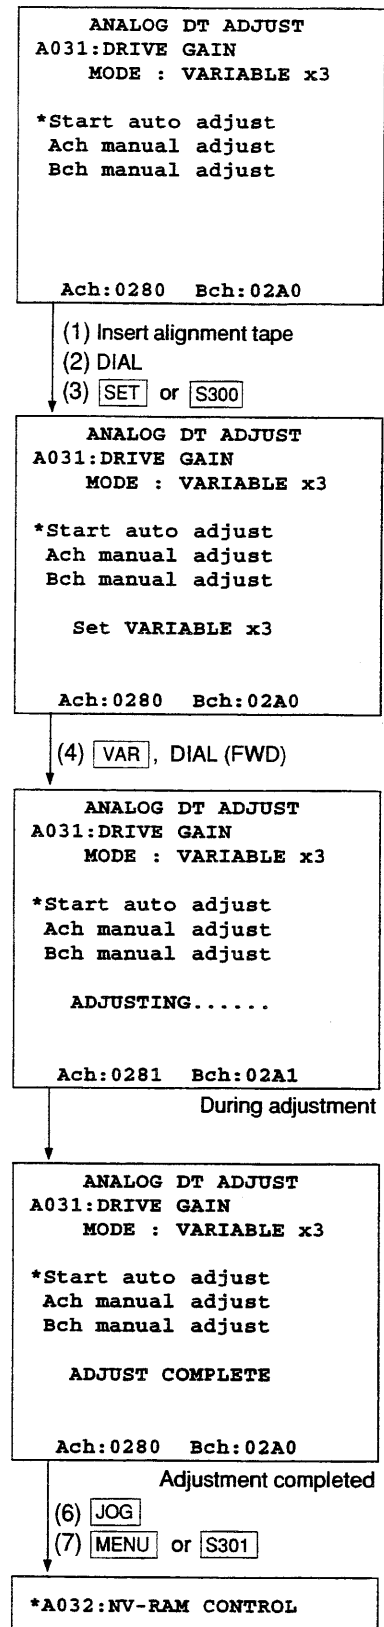

- (1) Insert alignment tape CR5-1BPS/1B or CR5-2APS/2A whose beginning is beforehand located in the color bars signal portion into this unit.
 CR5-1B PS: TC 00:14:00:00 } for DVW-A500P
 CR5-2A PS: TC 00:00:00:00 }
 CR5-1B : TC 00:14:00:00 } for DVW-A500
 CR5-2A : TC 00:00:00:00 }
- (2) Set the "*" mark to "Start auto adjust" using a search dial (JOG mode).
- (3) Press the SET button (or switch S300 on the SS board).
 (If the unit has already entered the variable three times (×3) the normal mode, the adjustment is initiated.)
- (4) The "Set VARIABLE ×3" message is displayed on the monitor screen.
 Press the VAR button, then turn the search dial in the forward direction and put the unit into the variable three times (×3) the normal mode to initiate the adjustment.

During adjustment, the "ADJUSTING....." message is displayed on the monitor screen. The data value then changes.

- (5) After adjustment is completed, the "ADJUST COMPLETE" message is displayed on the monitor screen.
- (6) Press the JOG button.
 (Set the search dial to the JOG mode)
- (7) Press the MENU button (or switch S301 on the SS board) to return to the ANALOG DT ADJUST menu screen.
- (8) To save the adjustment data in an NV-RAM, execute the "A032: NV-RAM CONTROL" mode.

How to eject the cassette tape

Return to the menu in the servo/DT system adjustment mode. The cassette tape is then ejected automatically.

In case of NG; (The screen at right is one example.)
When the “ADJUST COMPLETE” message is not displayed on the monitor screen, perform the following check and confirmation.

- (1) Perform the “C060: SG LOOP CHECK” in the analog DT system.
- (2) Confirm that the signals at pins 9A and 9B of connector CN123 on the SS board are synchronized.

CN123-9A: Y WZ ()
CN123-9B: C WZ ()

When no signals exist and are synchronized, check the DM-89 board, TBC-24/23 boards, then EQ board.
When signals exist and are synchronized, check the SS board.

Adjustment NG

c) A032: NV-RAM CONTROL

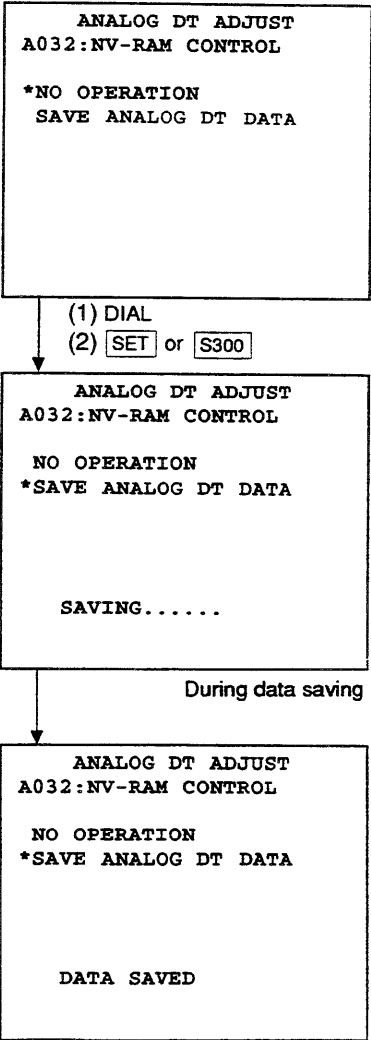

This mode saves the analog DT system adjustment data in an NV-RAM.

- (1) Set the “*” mark to “SAVE ANALOG DT DATA” using a search dial (JOG mode).

- (2) Press the SET button (or switch S300 on the SS board) to initiate the data transfer. The “SAVING.....” message is then displayed on the monitor screen.

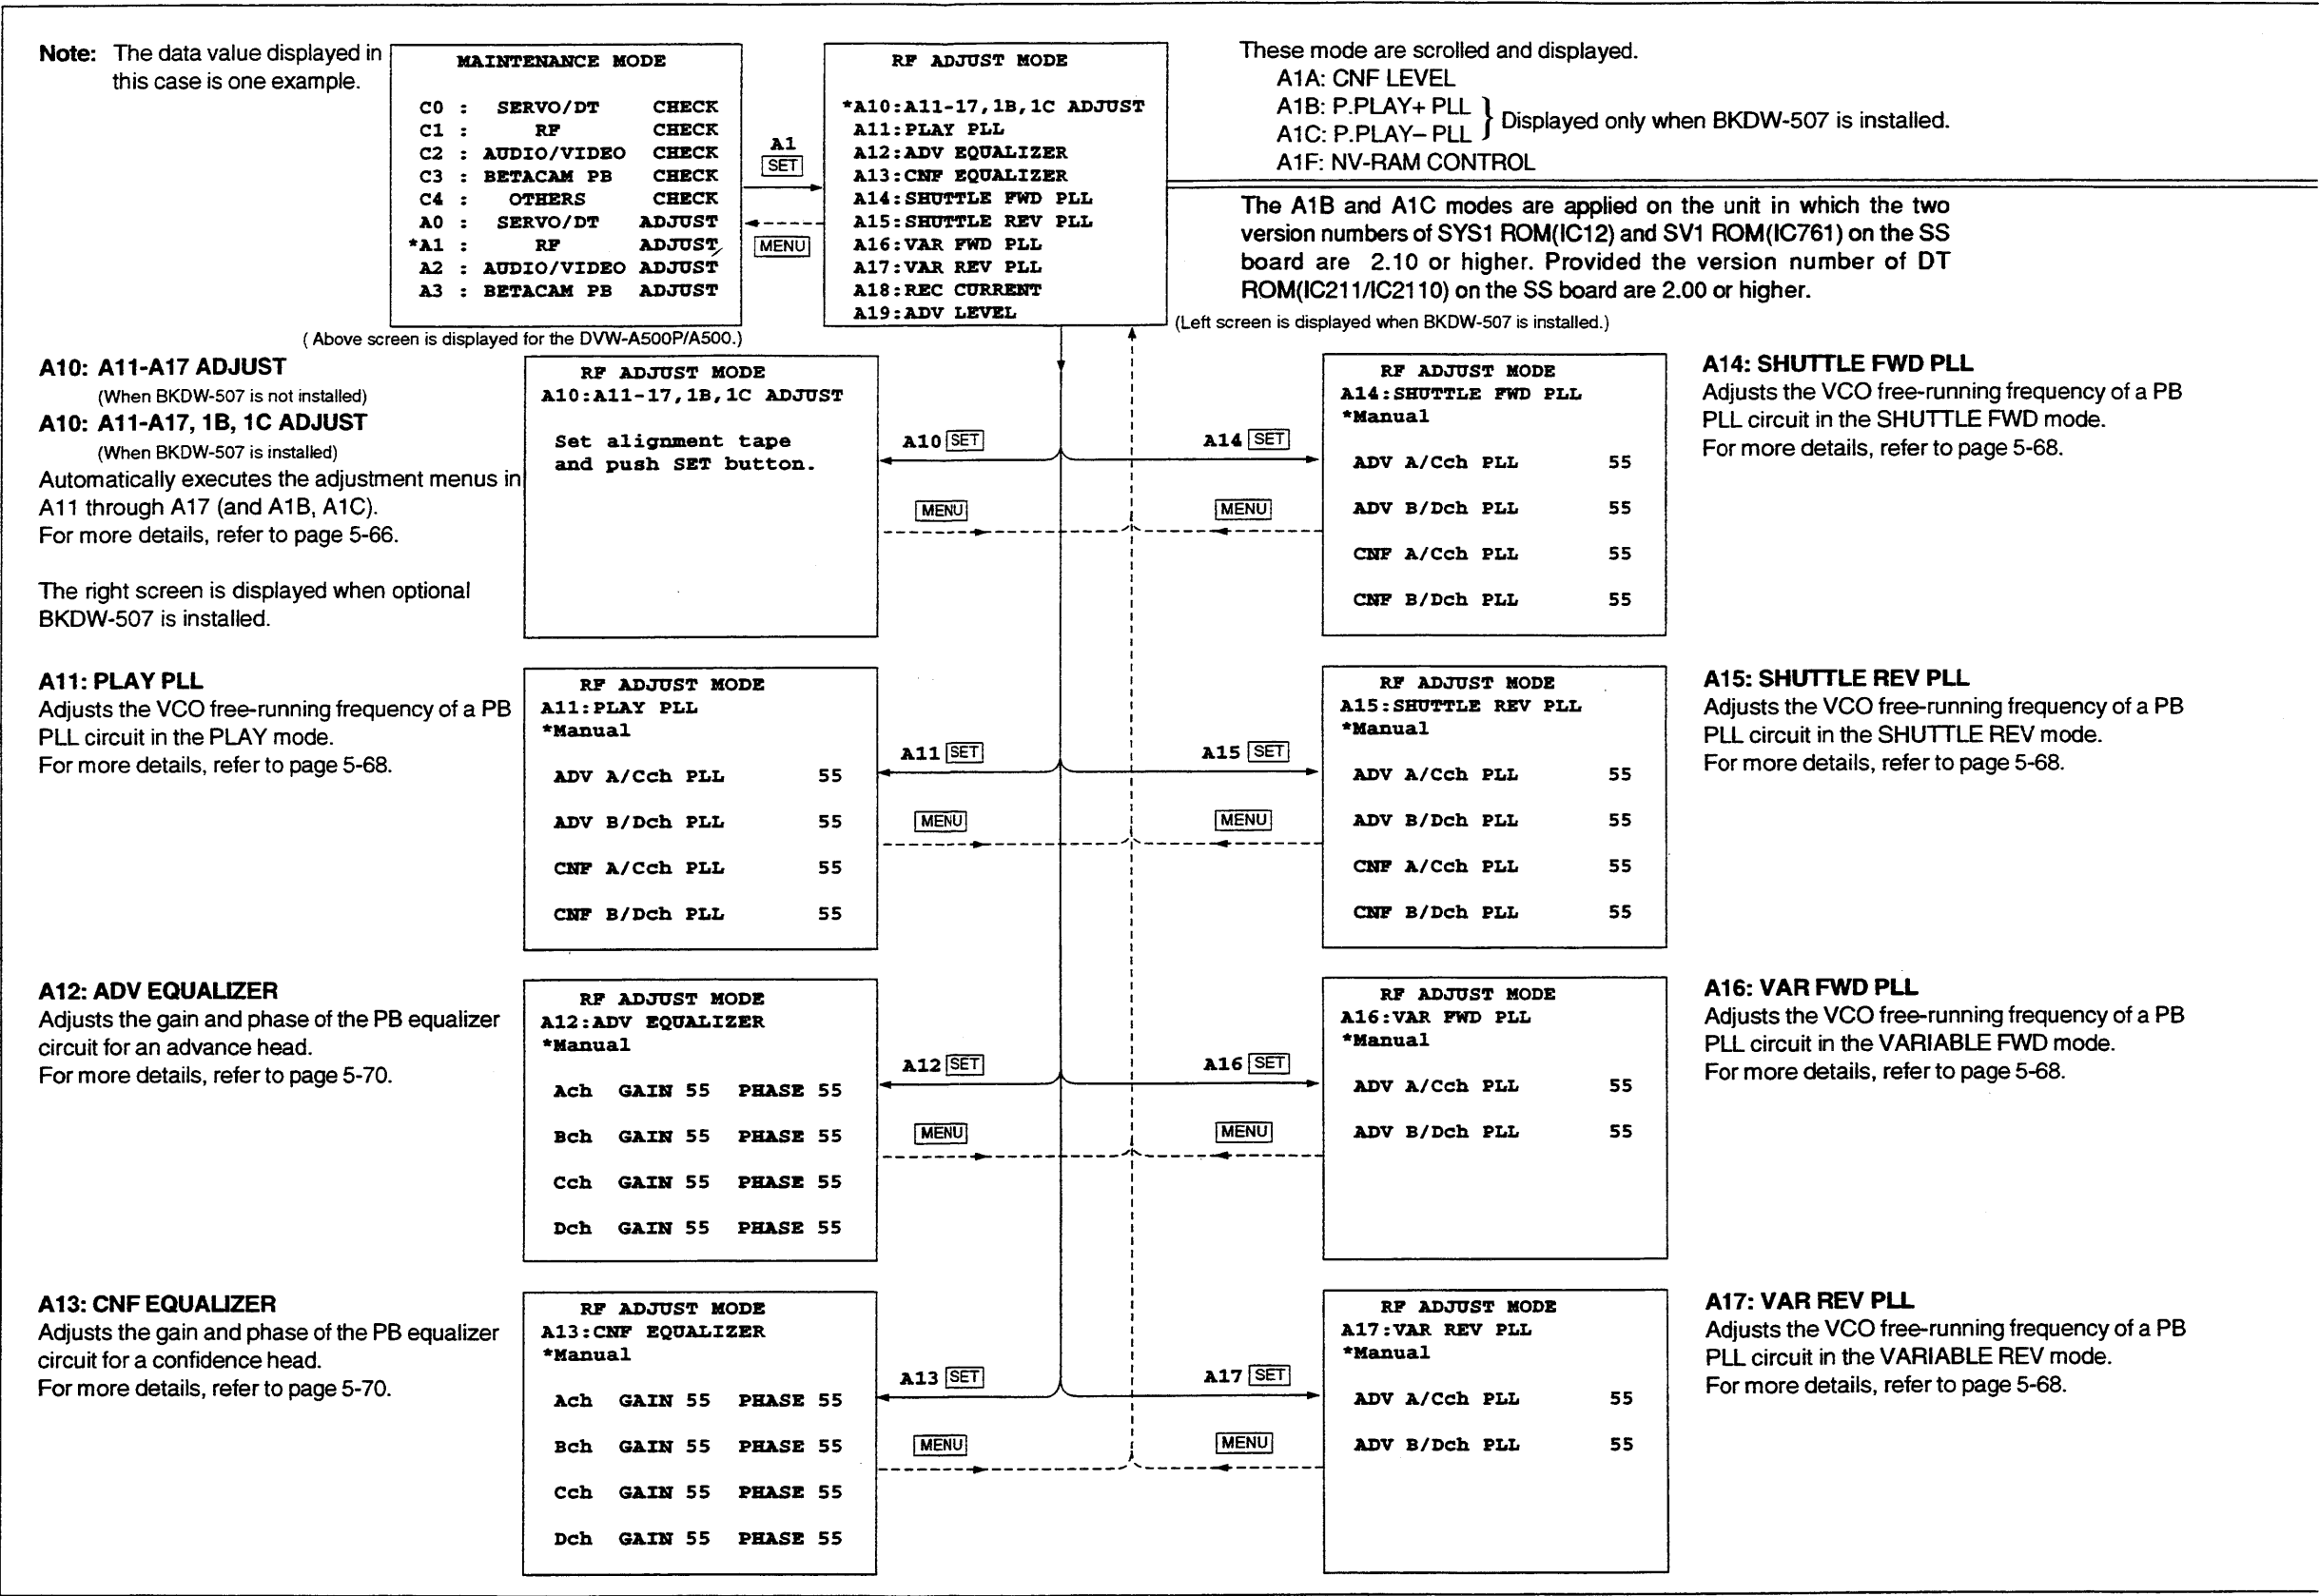

- (3) After data transfer is completed, the “DATA SAVED” message is displayed on the monitor screen.

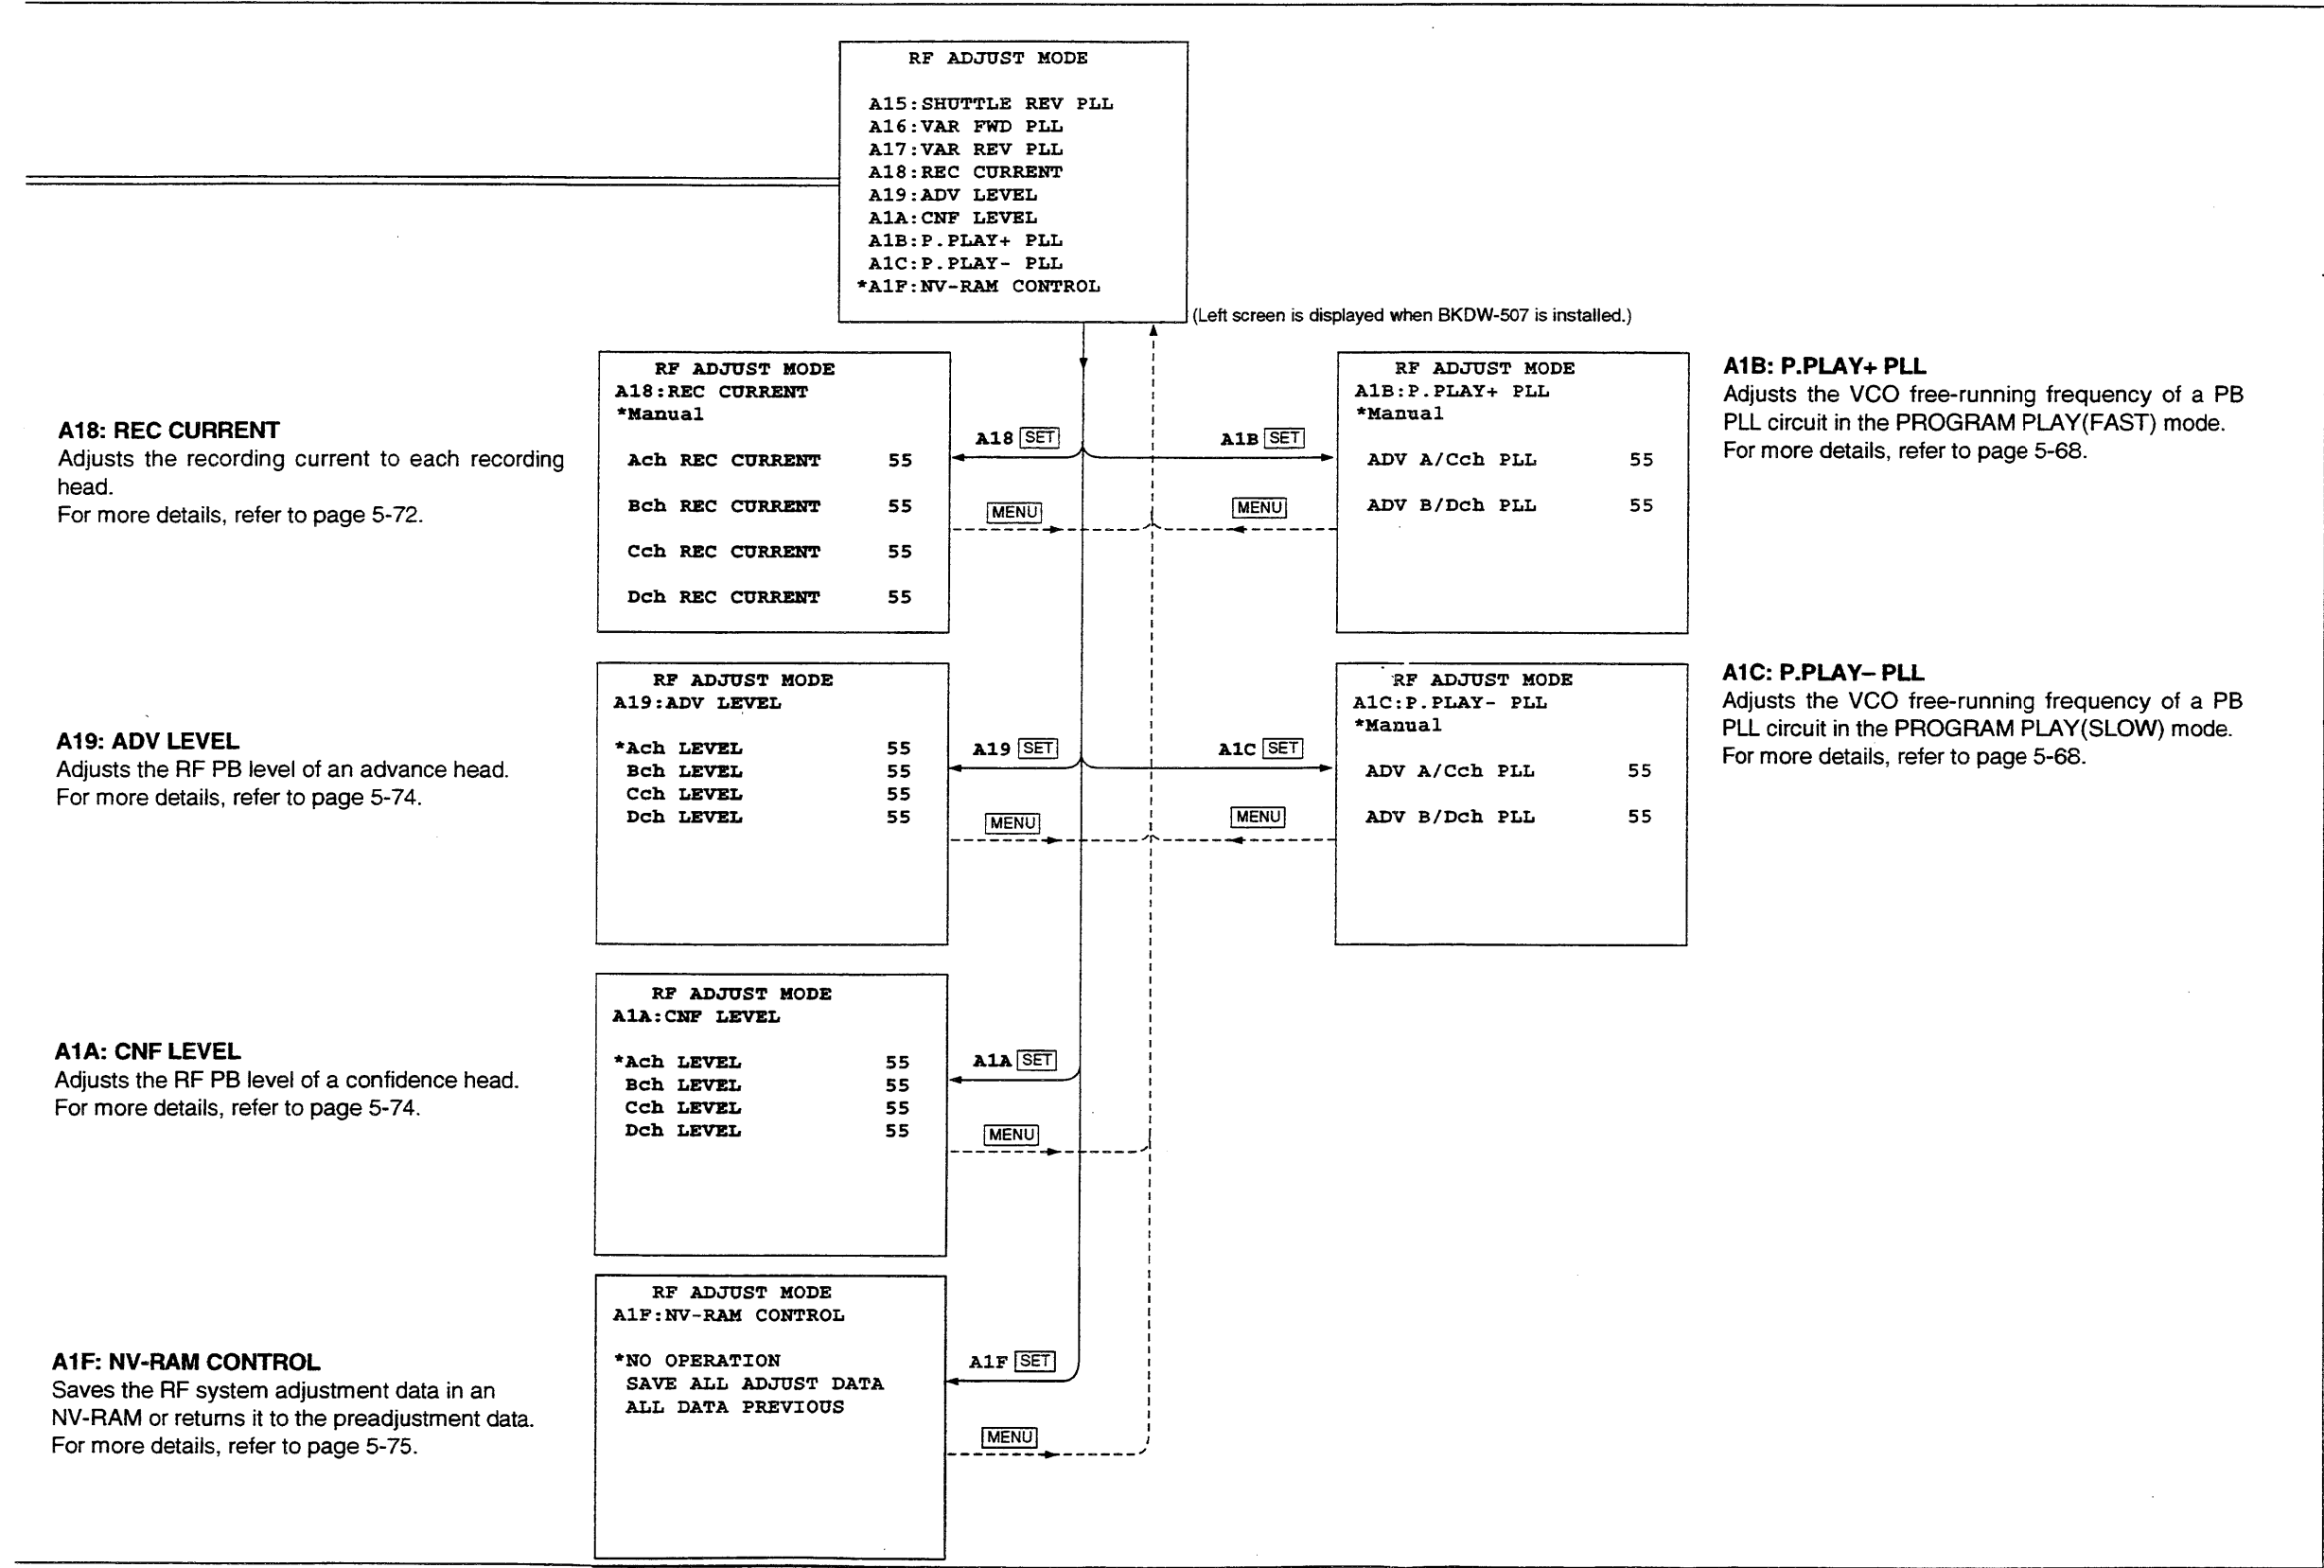

Note: If the power of this unit is turned off without saving the adjustment data in an NV-RAM after adjustment is completed, the adjustment data in the analog DT system returns to the preadjustment state.

5-8. RF SYSTEM ADJUSTMENT MODE (A1: RF ADJUST)

This mode can adjustment the RF system. (Do it with the pre-read off.)
For how to activate and terminate the maintenance mode, refer to page 5-3.

a) A10: A11-A17 ADJUST/A10: A11-17, 1B, 1C ADJUST

This mode executes the following adjustment menus automatically and continuously.

A11: PLAY PLL
A12: ADV EQUALIZER
A13: CNF EQUALIZER
A14: SHUTTLE FWD PLL
A15: SHUTTLE REV PLL
A16: VAR FWD PLL
A17: VAR REV PLL

A1B: P.PLAY+ PLL } These adjustment modes are performed when
A1C: P.PLAY- PLL } BKDW-507 is installed.

- (1) Insert alignment tape ZR5-1P/1 into this unit (with the tape rewound in advance).
ZR5-1P ; for DVW-A500P/500P
ZR5-1 ; for DVW-A500/500

- (2) Press the SET button (or switch S300 on the SS board) to initiate the adjustment.

The "A11: PLAY PLL" adjustment is performed first.
The "Adjusting..." message is displayed during adjustment.

As the adjustment progresses, the display in the fourth line (※) changes.

Note: The "Adjust Incomplete" message is displayed when the tape running stops during adjustment.

- (3) If no abnormality is found after all the adjustments are completed, the "Adjust Complete" message is displayed on the monitor screen.

- (4) Press the MENU button (or switch S301 on the SS board) to return to the RF ADJUST MODE menu screen.

- (5) To save the adjustment data in an NV-RAM, execute the "A1F: NV-RAM CONTROL" mode.

**b) A11: PLAY PLL**

A14: SHUTTLE FWD PLL

A15: SHUTTLE REV PLL

A16: VAR FWD PLL

A17: VAR REV PLL

A1B: P.PLAY+ PLL } These adjustment modes are displayed when
A1C: P.PLAY- PLL } BKDW-507 is installed.

These modes adjust the VCO free-running frequency of a PB PLL circuit in the following PB modes. For these modes, manual or automatic adjustment can be selected. In this case, only the automatic adjustment is described on the next page with "A11: PLAY PLL" as an example.

A11: PLAY mode
A14: SHUTTLE FWD mode [Tape top]
A15: SHUTTLE REV mode [Tape end]
A16: VARIABLE FWD mode
A17: VARIABLE REV mode
A1B: PROGRAM PLAY(FAST) mode
A1C: PROGRAM PLAY(SLOW) mode

Note: The "Adjust Incomplete" message is displayed when the tape running stops during adjustment.

In this case, rewind or fast forward the alignment tape, then readjust.

For the adjustment in the SHUTTLE mode, especially, put the tape into the state in [] mentioned above, then adjust.

Operation during automatic adjustment

(The monitor screen is displayed as an example of "A11: PLAY PLL". The displayed data value and the ">" number are an example.)

- (1) Change "Manual" to "Auto".

Set the "*" mark to "Manual" using a search dial. After that, turn the search dial in the forward (\odot) direction while pressing and holding the JOG (or SHUTTLE) button.

The "Auto (Push SET button)" message is then displayed on the monitor screen.

- (2) Insert alignment tape ZR5-1P/1 into this unit and press the SET button (or switch S300 on the SS board). The tape then runs, and the adjustment is initiated.

ZR5-1P ; for DVW-A500P/500P

ZR5-1 ; for DVW-A500/500

When the SET button (or switch S300) is pressed without inserting the alignment tape, the "Waiting ..." message is displayed until the alignment tape is inserted.

During adjustment, the "Auto Adjusting ..." message is displayed on the monitor screen.

Note: The "Adjust Incomplete" message is displayed when the tape running stops during adjustment.

- (3) After adjustment is completed, the "Auto Adjust Complete" message is displayed on the monitor screen. The tape running then stops.

- (4) Press the MENU button (or switch S301 on the SS board) to return to the RF ADJUST MODE menu screen.

- (5) To save the adjustment data in an NV-RAM, execute the "A1F: NV-RAM CONTROL" mode.

c) **A12: ADV EQUALIZER**
A13: CNF EQUALIZER

These modes adjust the gain and phase of the PB equalizer circuit for each head below. For these modes, manual or automatic adjustment can be selected. In this case, only the automatic adjustment operation is described on the next page with "A12: ADV EQUALIZER" as an example.

A12: Advance head

A13: Confidence head

Note: The "Adjust Incomplete" message is displayed when the tape running stops during adjustment.

In this case, rewind or fast forward the alignment tape, then readjust.

Operation during automatic adjustment

(The monitor screen is displayed as an example of "A12: ADV EQUALIZER". The displayed data value and the ">" number are an example.)

- (1) Change "Manual" to "Auto".

Set the "*" mark to "Manual" using a search dial. After that, turn the search dial in the forward (\odot) direction while pressing and holding the JOG (or SHUTTLE) button.

The "Auto (Push SET button)" message is then displayed on the monitor screen.

- (2) Insert alignment tape ZR5-1P/1 into this unit and press the SET button (or switch S300 on the SS board). The tape then runs, and the adjustment is initiated.

ZR5-1P ; for DVW-A500P/500P

ZR5-1 ; for DVW-A500/500

When the SET button (or switch S300) is pressed without inserting the alignment tape, the "Waiting ..." message is displayed until the alignment tape is inserted.

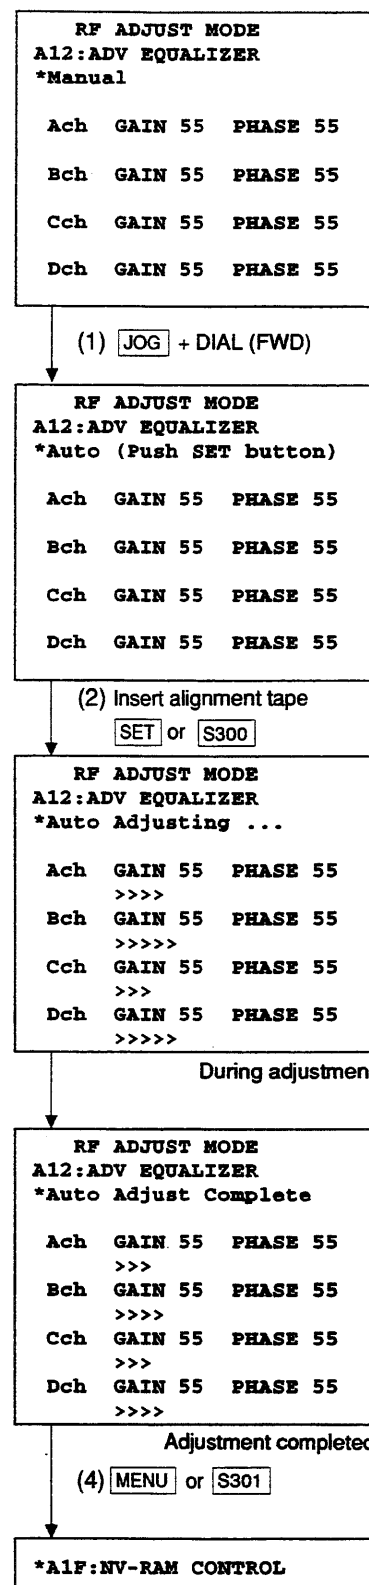

During adjustment, the "Auto Adjusting ..." message is displayed on the monitor screen.

Note: The "Adjust Incomplete" message is displayed when the tape running stops during adjustment.

- (3) After adjustment is completed, the "Auto Adjust Complete" message is displayed on the monitor screen. The tape running then stops.

- (4) Press the MENU button (or switch S301 on the SS board) to return to the RF ADJUST MODE menu screen.

- (5) To save the adjustment data in an NV-RAM, execute the "A1F: NV-RAM CONTROL" mode.

d) A18: REC CURRENT

This mode adjusts the recording current to each recording head. Manual adjustment or automatic adjustment can be selected. Only the automatic adjustment operation is described in this case.

(The displayed data value and the ">" number are one example.)

- (0) Output a 100% / 75% color bars signal in advance from the internal video test signal generator of this unit as a recording signal source.
(Set in "C21: VIDEO TEST SG".)

- (1) Change "Manual" to "Auto".

Set the "*" mark to "Manual" using a search dial. After that, turn the search dial in the forward (\odot) direction while pressing and holding the JOG (or SHUTTLE) button.

The "Auto (Push SET button)" message is then displayed on the monitor screen.

- (2) Insert a recording digital tape into this unit and press the SET button (or switch S300 on the SS board). The tape then runs, and the adjustment is initiated.

When the SET button (or switch S300) is pressed without inserting the recording tape, the "Waiting ..." message is displayed until the tape is inserted.

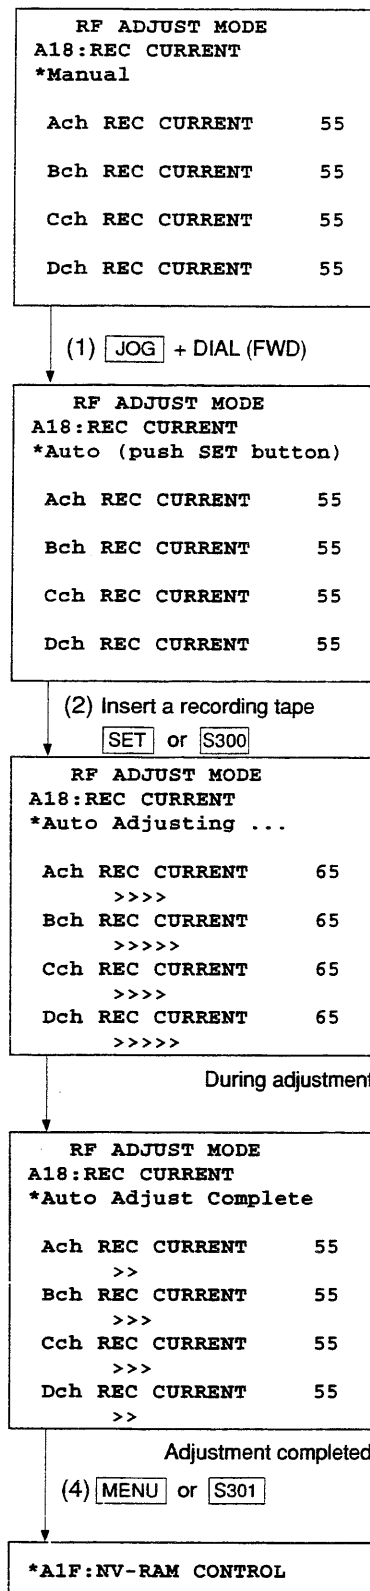

During adjustment, the "Auto Adjusting ..." message is displayed on the monitor screen.

Note: The "Adjust Incomplete" message is displayed when the tape running stops during adjustment.

- (3) After adjustment is completed, the "Auto Adjust Complete" message is displayed on the monitor screen. The tape running then stops.

- (4) Press the MENU button (or switch S301 on the SS board) to return to the RF ADJUST MODE menu screen.

- (5) To save the adjustment data in an NV-RAM, execute the "A1F: NV-RAM CONTROL" mode.

e) **A19: ADV LEVEL**
A1A: CNF LEVEL

These modes adjust the RF PB level of each head below. The RF PB level is adjusted manually. Only the manual adjustment operation is described on the next page with "A19: ADV LEVEL" as an example.

A19: Advance head
A1A: Confidence head

Caution: Do not change the adjustment data carelessly. This causes a trouble. To adjust the data, adjust it according to the adjustment described in the Maintenance Manual Part 2, Volume-1.

If the adjustment data has been changed carelessly, execute the "ALL DATA PREVIOUS" mode in A1F: NV-RAM CONTROL or turn off the power of this unit without executing the A1F: NV-RAM CONTROL. Never execute the "SAVE ALL ADJUST DATA" mode.

Operation during manual adjustment

(The monitor screen is displayed as an example of "A19: ADV LEVEL". The displayed data value is an example.)

- (1) Press the SET button (or switch S300 on the SS board). At that time, the unit temporarily exits the maintenance mode. This enables the normal operation. (Prompt "■" is displayed in the upper-right position of the superimposed screen, and the time counter is put into the normal state.)

- (2) Insert alignment tape ZR5-1P/1 into this unit and press the PLAY button.

ZR5-1P ; for DVW-A500P/500P
ZR5-1 ; for DVW-A500/500

- (3) Press the MENU button (or switch S301 on the SS board) to return to the maintenance mode. (The "■" prompt display disappears on the screen, and the time counter displays the menu number.)

- (4) Set "*" mark to the channel to be adjusted using a search dial (JOG mode).

- (5) Turn the search dial to change the data while pressing the JOG (or SHUTTLE) button.

FWD (\curvearrowright) : Increases the data value. (FF is followed by 00.)
REV (\curvearrowleft) : Decreases the data value. (00 is followed by FF.)

- (6) For any other channels, repeat steps (4) and (5).

- (7) After adjustment is completed, press the MENU button (or switch S301 on the SS board) to return to the RF ADJUST MODE menu screen.

- (8) To save the adjustment data in an NV-RAM, execute the "A1F: NV-RAM CONTROL" mode.

5-9. AUDIO/VIDEO SYSTEM ADJUSTMENT MODE (A2: AUDIO/VIDEO ADJUST)

This section describes the "A2: AUDIO/VIDEO ADJUST" mode.

For how to activate and terminate the maintenance mode, refer to page 5-3.

Caution: Do not change the adjustment data carelessly. This causes a trouble. To adjust the data, adjust it according to the operation described in section 6 or 8 of this manual.

[For the BKDW-506/505 (optional equipment), refer to the Installation Manual.]

For the items not described in section 6 or 8, perform each adjustment according to the adjustment in the Maintenance Manual Part 2, Volume-1.

If the adjustment data has been changed carelessly, execute the "ALL DATA PREVIOUS" mode in A2F: NV-RAM CONTROL or turn off the power of this unit without executing the A2F: NV-RAM CONTROL.

Never execute the "SAVE ALL ADJUST DATA" mode.

a) Operation during manual adjustment (not including "A24: INPUT CF DETECT")

- (1) Set the "*" mark to the item to be adjusted using a search dial (JOG mode).
- (2) Turn the search dial to change the data while pressing and holding the JOG (or SHUTTLE) button.

FWD (): Increases the data value. (FF is followed by 00.)
REV (): Decreases the data value. (00 is followed by FF.)

- (3) For any other items, repeat steps (1) and (2).
- (4) After adjustment is completed, press the MENU button (or switch S301 on the SS board) to return to the AUDIO/VIDEO ADJUST MODE menu screen.
- (5) To save the adjustment data in an NV-RAM, execute the "A2F: NV-RAM CONTROL" mode.

b) Operation during automatic adjustment (for "A24: INPUT CF DETECT")

- (1) Change "Manual" to "Auto".

Set the "*" mark to "Manual" using a search dial. After that, turn the search dial in the forward () direction while pressing and holding the JOG (or SHUTTLE) button.

The "Auto (Push SET button)" message is then displayed on the monitor screen.

- (2) Press the SET button (or switch S300 on the SS board) to initiate the adjustment. The "Auto Adjusting ..." message is then displayed on the monitor screen.
- (3) After adjustment is completed, the "Auto Adjust Complete" message is displayed on the monitor screen.
- (4) Press the MENU button (or switch S301 on the SS board) to return to the AUDIO/VIDEO ADJUST menu screen.
- (5) To save the adjustment data in an NV-RAM, execute the "A2F: NV-RAM CONTROL" mode.

c) A2F: NV-RAM CONTROL

This mode saves the audio/video system adjustment data in an NV-RAM or returns it to the preadjustment state without saving the audio/video system adjustment data.

Caution: Once the audio/video system adjustment data is saved in an NV-RAM, it cannot return to the preadjustment state.

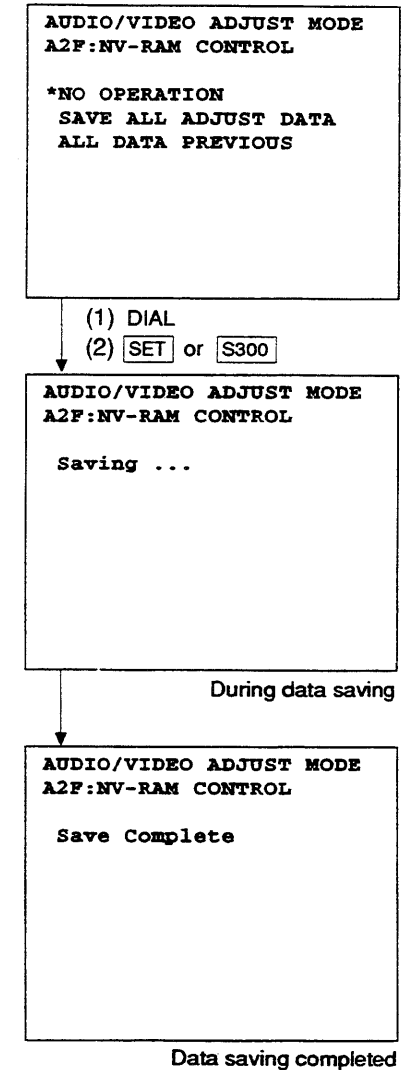

- (1) Using a search dial (JOG mode), set the "*" mark as follows:
Set it to "SAVE ALL ADJUST DATA" when the adjustment data after adjustment is saved.
Set it to "ALL DATA PREVIOUS" when the adjustment data before adjustment is returned.

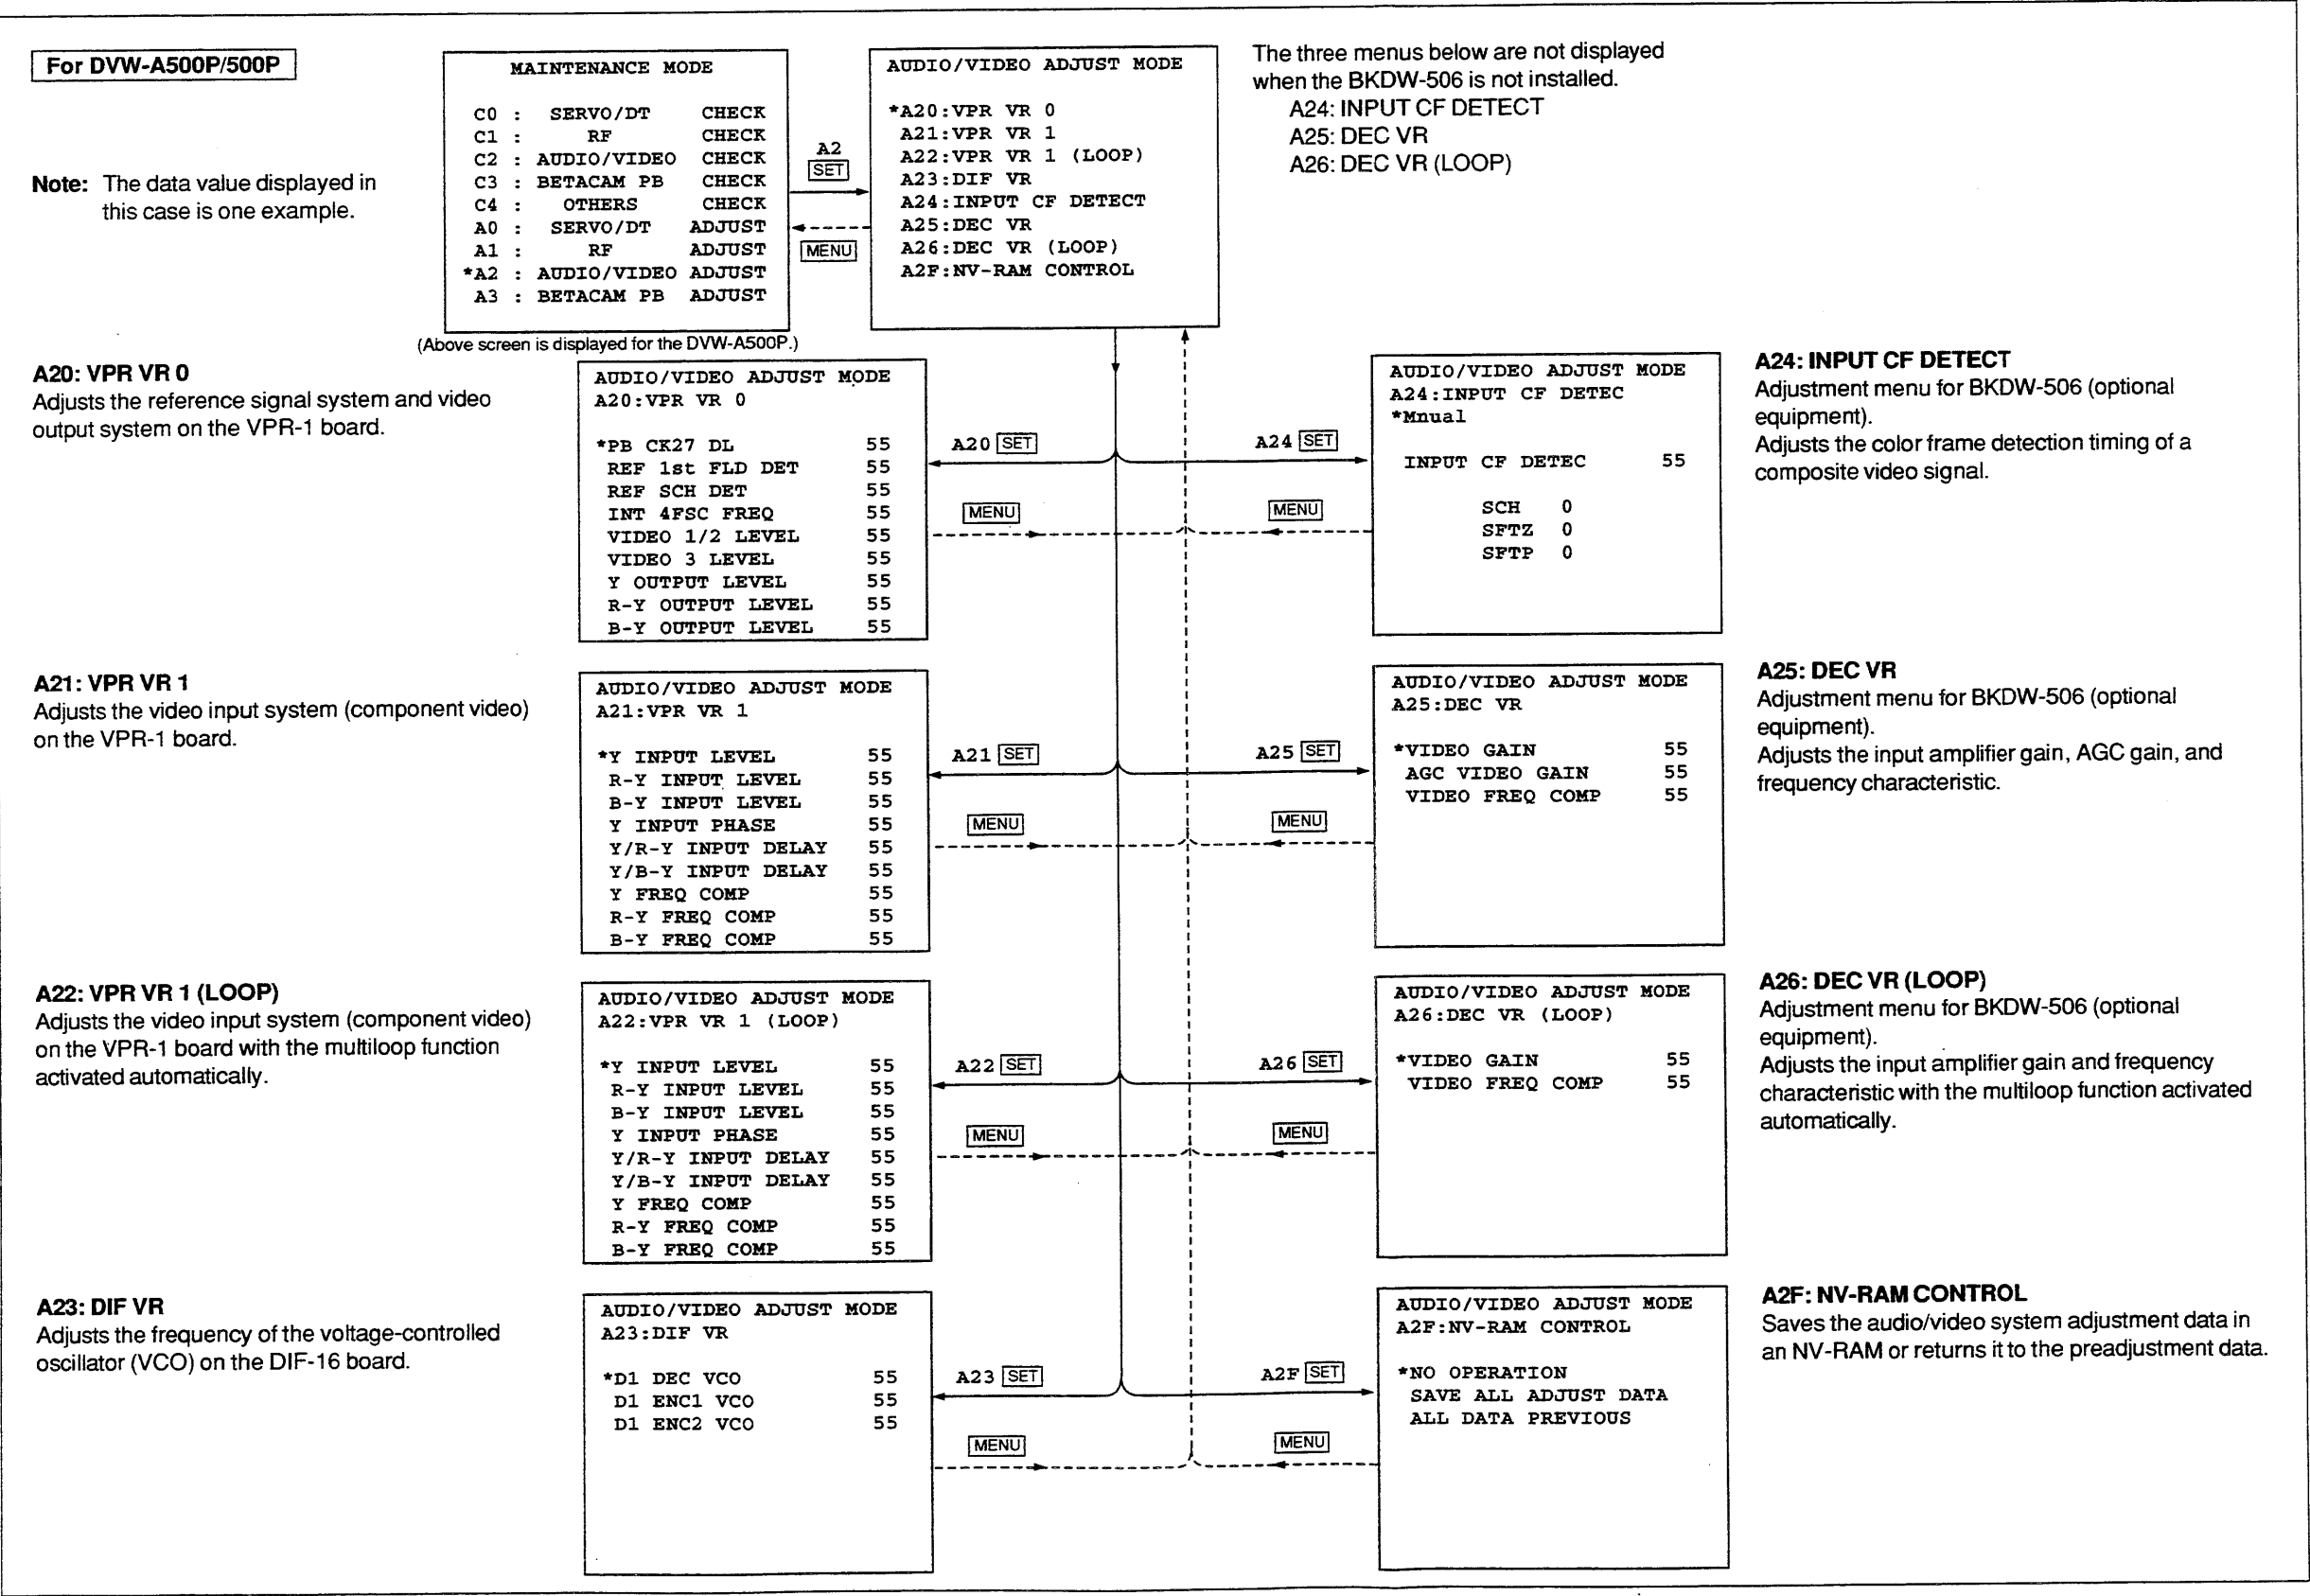

- (2) Press the SET button (or switch S300 on the SS board) to initiate the data transfer. The monitor screen at right is displayed when the adjustment data is saved. The "Loading ..." message is displayed when the adjustment data before adjustment is returned.

- (3) After data transfer is completed, the "Complete" message is displayed on the monitor screen.

The monitor screen at right is displayed when the adjustment data is saved. The "Load Complete" message is displayed when the adjustment data before adjustment is returned.

Note: If the power of this unit is turned off without saving the adjustment data in an NV-RAM after adjustment is completed, the adjustment data in the audio/video system returns to the preadjustment state.

For DVW-A500/500

Note: The data value displayed in this case is one example.

SAVE ALL ADJUST DATA	
ALL DATA PREVIOUS	

A2F: NV-RAM CONTROL

Saves the audio/video system adjustment data in an NV-RAM or returns it to the preadjustment data.

5-10. BETACAM PB SYSTEM ADJUSTMENT MODE (For DVW-A500P/A500) (A3: BETACAM PB ADJUST)

This section describes the “A3: BEATCAM PB ADJUST” mode.
For how to activate and terminate the maintenance mode, refer to page 5-3.

Caution: Do not change the adjustment data carelessly. This causes a trouble. To adjust the data, adjust it according to the operation described in section 6 or 8 of this manual.
For the items not described in section 6 or 8, perform each adjustment according to the adjustment in the Maintenance Manual Part 2, Volume-1.

If the adjustment data has been changed carelessly, execute the “ALL DATA PREVIOUS” mode in A3F: NV-RAM CONTROL or turn off the power of this unit without executing the A3F: NV-RAM CONTROL.
Never execute the “SAVE ALL ADJUST DATA” mode.

a) Operation during manual adjustment (data setting)

- (1) If the specified alignment tape has already been inserted and the specified tape portion has been played back, steps (2),(3), and (4) are omitted.
For the item in which the playback of an alignment tape is not required, proceed to step (5).
- (2) Press the SET button (or switch S300 on the SS board). At that time, the unit temporarily exits the maintenance mode. This enables the normal operation.
(Prompt “■” is displayed in the upper-right position of the superimposed screen, and the time counter is put into the normal state.)
- (3) Insert the specified alignment tape into this unit and play back it from the specified tape portion.
(For the guard band width adjustment in A35: DM VR 4, put the unit into the STOP mode.)
- (4) Press the MENU button (or switch S301 on the SS board) to return to the maintenance mode.
(The “■” prompt display disappears on the screen, and the time counter displays the menu number.)
- (5) Set the “*” mark to the item to be adjusted using a serach dial (JOG mode).
- (6) Turn the search dial to change the data while pressing and holding the JOG (or SHUTTLE) button.

FWD (◯): Increases the data value. (FF is followed by 00.)
REV (◯): Decreases the data value. (00 is followed by FF.)
- (7) For any other items, repeat steps (1) through (6).
- (8) After adjustment is completed, press the MENU button (or switch S301 on the SS board) to return to the BETACAM PB ADJUST mode menu screen.
- (9) To save the adjustment data in an NV-RAM, execute the “A3F: NV-RAM CONTROL” mode.

b) A3F: NV-RAM CONTROL

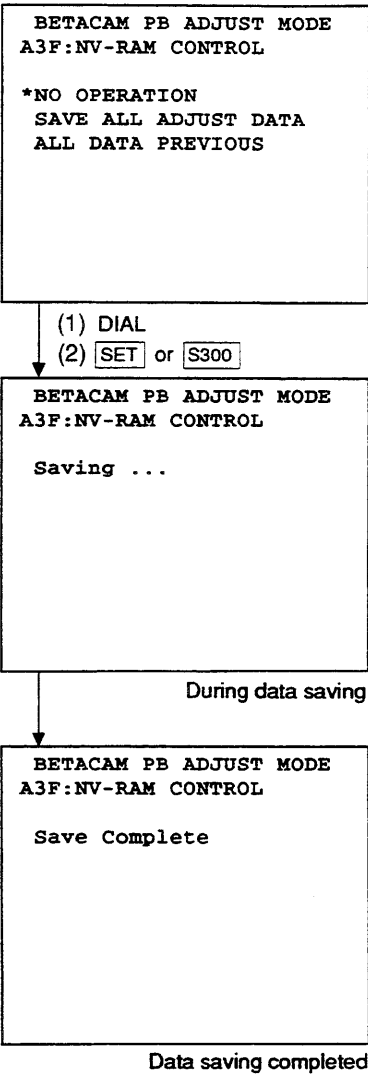

This mode saves the Betacam PB system adjustment data in an NV-RAM or returns it to the preadjustment state without saving the Betacam PB system adjustment data.

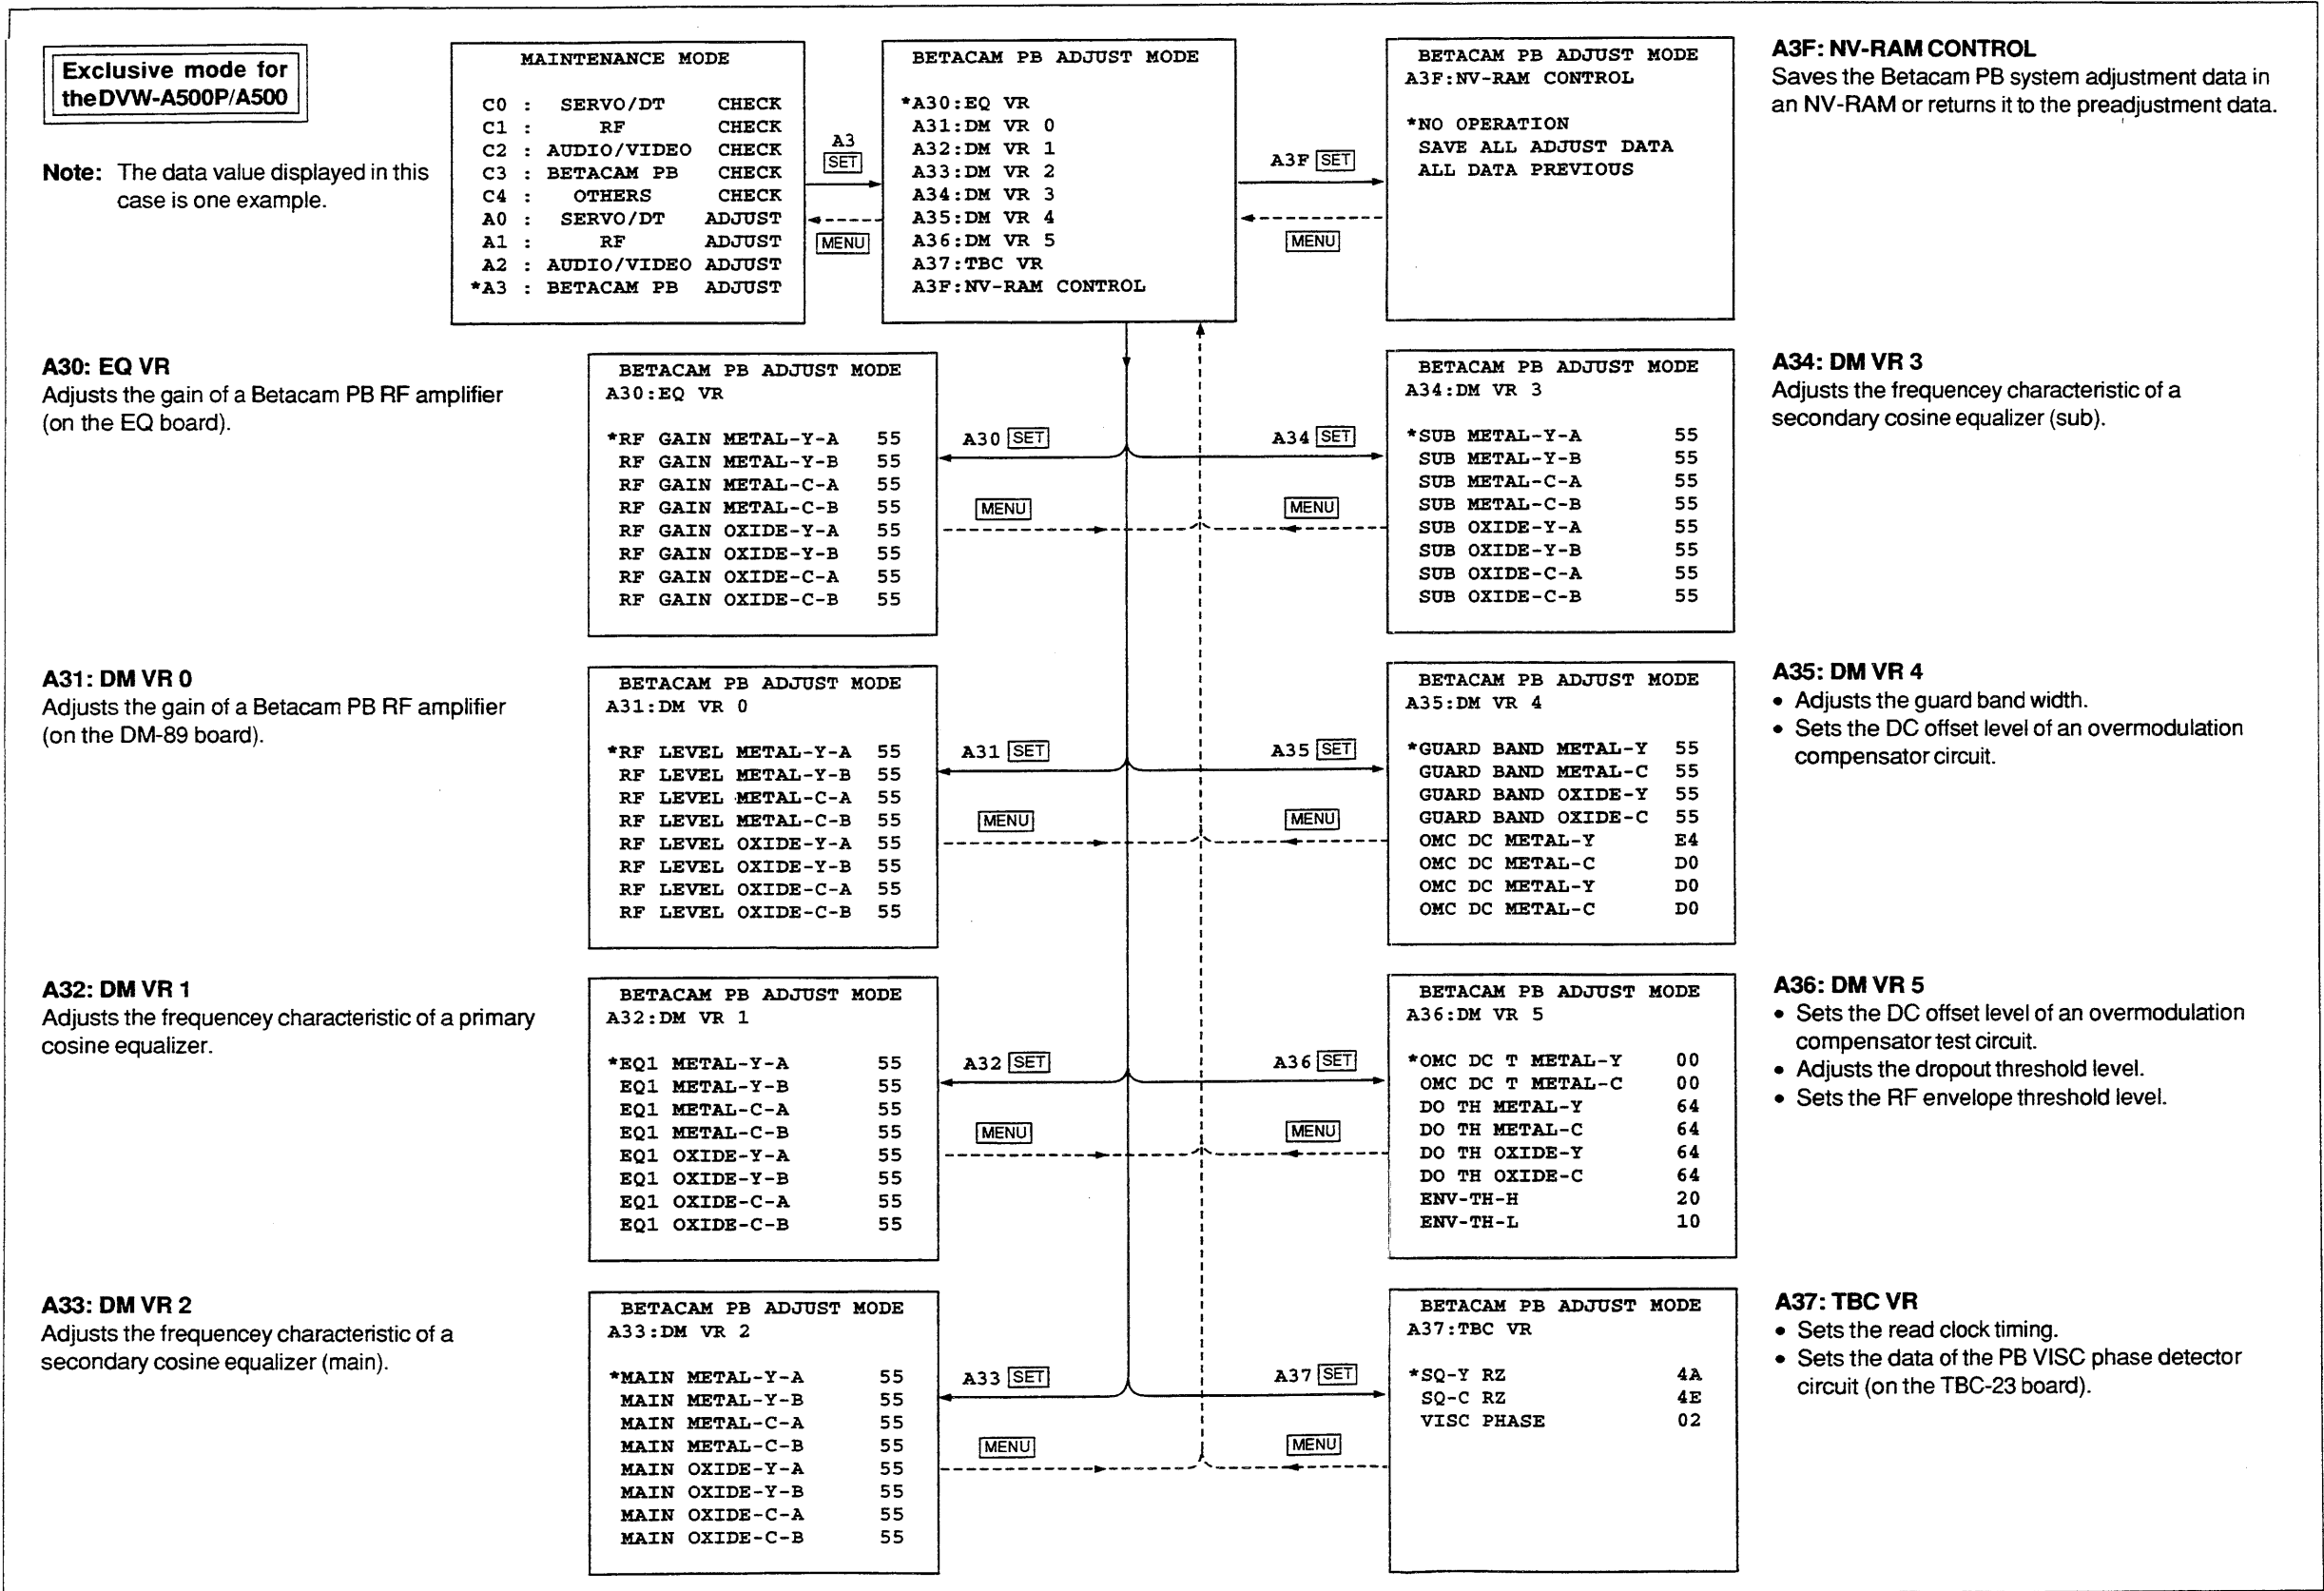

Caution: Once the Betacam PB system adjustment data is saved in an NV-RAM, it cannot return to the preadjustment state.

- (1) Using a search dial (JOG mode), set the “*” mark as follows:
Set it to “SAVE ALL ADJUST DATA” when the adjustment data after adjustment is saved.
Set it to “ALL DATA PREVIOUS” when the adjustment data before adjustment is returned.
- (2) Press the SET button (or switch S300 on the SS board) to initiate the data transfer.
The monitor screen at right is displayed when the adjustment data is saved. The “Loading ...” message is displayed when the adjustment data before adjustment is returned.
- (3) After data transfer is completed, the “Complete” message is displayed on the monitor screen.

The monitor screen at right is displayed when the adjustment data is saved.
The “Load Complete” message is displayed when the adjustment data before adjustment is returned.

Note: If the power of this unit is turned off without saving the adjustment data in an NV-RAM after adjustment is completed, the adjustment data in the Betacam PB system returns to the preadjustment state.

SECTION 6
REPLACEMENT OF POWER BLOCK AND CIRCUIT BOARDS

[Location]

<Top View>

<Bottom View>

<Front View>

<Rear View>

6-1-2. Plug-in Board Pulling Out/ Inserting

Always switch off the power before removing or installing the plug-in board.

Pulling out

- 1. Loosen a screw, and remove the board retainer (L) or (S).

- 2. Pull up the eject levers on the board in the direction of the arrows when pulling out the board from the connector.

Note

Do not try to pull the board by grasping any of the components on the board.
Pull out the board with equal force for both sides.

- 3. Disconnect the connected harness.

Inserting

1. Connect the disconnected harness.
2. Insert the board after pushing down the eject levers as shown in the figure.

3. Insert the protrusion of the board retainer (L) or (S) into the square hole, and tighten the screw.

6-1-3. Flexible Card Wire Replacement

Two 36P flexible card wires are used on between DR-307/200 board and HN-181 board. 13P flexible card wires are used on between DR-307/200 board and each reel motor. When handling the flexible card wire, be very careful not to bend it because this will markedly reduce its life.

Disconnection

1. Pull up the A portions of the connector.

Note

Never pull the flexible card wire first.

2. Pull out the flexible card wire from the connector.

Connection

1. Distinguish the front from back faces of the cable, then insert the cable into the connector.
2. Push down the A portions.

Note

The flexible card wire consists of conductor side and insulator side. The flexible card wire must be inserted with the conductor side facing the correct way. If the flexible card wire is inserted wrongly, the circuit will not operate.

CN214 and CN215 of the HN-181 board do not have a lock mechanism, so these connector's flexible card wire replacement are performed if only pulling out and inserting the cable.

6-2. POWER BLOCK/BOARD REPLACEMENT

After replacing this board, electrical adjustment should be performed.

(Refer to maintenance manual Part 2.)

1. Remove the power panel.
(Refer to section 1-2-4.)
2. Disconnect six connectors (CN101, CN201, CN202, CN203, CN204 and CN206).

3. Remove two screws, and remove the power block.

6-2. POWER BLOCK/BOARD REPLACEMENT

4. Remove three screws, and disassemble the power block.

5. Remove four screws, disconnect connector (CN102) and remove the SOPS-1042B board.

6-2. POWER BLOCK/BOARD REPLACEMENT

6. Remove three screws, and remove the SOPS-1042A board.

7. Install the power block/board in the reverse order of steps 1 through 6.

6-3. HOW TO REPLACE BOARDS

6-3-1. SWC-17 Board

1. Turn off the power.
2. Remove the upper lid.
(Refer to section 1-2-1.)
3. Remove the MD plate.
(Refer to section 1-3.)
4. Remove the cassette compartment assembly.
(Refer to section 1-2-2.)
5. Remove the upper control panel.
(Refer to section 1-2-1.)
6. Remove two screws, and remove the SC guide assembly.

7. Disconnect the connector (CN500), remove six screws and pull out the front (upper) chassis assembly.

8. Undo the PCB holder, and open the FP-58 board to rear.

9. Disconnect connector (CN501) on the FP-58 board.

10. Remove three screws, and remove the SWC-17 board by lift the board after inclining to rear.

11. Install the SWC-17 board in the reverse order of steps 1 through 10.

6-3-2. FP-58 Board

After replacing this board, preset level adjustment (PROCESS CONTROL switch : REMOTE) should be performed.

(Refer to maintenance manual Part 2.)

1. Turn off the power.
2. Remove the upper lid.
(Refer to section 1-2-1.)
3. Remove the MD plate.
(Refer to section 1-3.)
4. Remove the cassette compartment assembly.
(Refer to section 1-2-2.)
5. Remove the upper control panel.
(Refer to section 1-2-1.)
6. Remove two screws, and remove the SC guide assembly.
(Refer to section 6-3-1.)
7. Disconnect connector (CN500), remove six screws and pull out the front (upper) chassis assembly.
(Refer to section 6-3-1.)
8. Undo the PCB holder, and open the FP-58 board to rear.
9. Disconnect connector (CN501) on the FP-58 board.
(Refer to section 6-3-1.)
10. Remove two screws, and remove the power switch.
11. Disconnect connector (CN512) on the VR-152 board, connector (CN570) on the SWC-18 board and connector (CN505) on the FP-58 board, and remove the front (upper) chassis assembly.

12. Disconnect connector (CN503), and remove the FP-58 board.

13. Install the FP-58 board in the reverse order of steps 1 through 12.

Note

When connecting connector (CN503), put the protrusions of the connector on the VR-153 board in the hollow of CN503, then stand the FP-58 board.

6-3-3. VR-152 Board

After replacing this board, audio unity level adjustment should be performed.
(Refer to maintenance manual Part 2.)

1. Turn off the power.
2. Remove the upper lid.
(Refer to section 1-2-1.)
3. Remove the MD plate.
(Refer to section 1-3)
4. Remove the cassette compartment assembly.
(Refer to section 1-2-2.)
5. Remove the upper control panel.
(Refer to section 1-2-1.)
6. Remove two screws, and remove the SC guide assembly.

7. Disconnect connector (CN500), remove six screws and pull out the front (upper) chassis assembly.

8. Undo the PCB holder, and open the FP-58 board.

9. Disconnect connector (CN501) on the FP-58 board.

10. Remove two screws, and remove the power switch.
11. Disconnect connector (CN512) on the VR-152 board, connector (CN570) on the SWC-18 board and connector (CN505) on the FP-58 board, and remove the front (upper) chassis assembly.

12. Disconnect connector (CN503), and remove the FP-58 board.

13. Remove the nut of HEADPHONES jack.
14. Remove two screws, and remove the volume bracket.

15. Disconnect two connectors (CN510 and CN511).

16. Remove six nuts and washers, and remove the VR-152 board.

17. Install the VR-152 board in the reverse order of steps 1 through 16.

Note

After installing the nuts, apply locking compound.

6-3-4. VR-153 Board

After replacing this board, audio PB level adjustment should be performed.

(Refer to maintenance manual Part 2.)

1. Turn off the power.
2. Remove the upper lid.
(Refer to section 1-2-1.)
3. Remove the MD plate.
(Refer to section 1-3.)
4. Remove the cassette compartment assembly.
(Refer to section 1-2-2.)
5. Remove the upper control panel.
(Refer to section 1-2-1.)
6. Remove two screws, and remove the SC guide assembly.
(Refer to section 6-3-3.)
7. Disconnect connector (CN500), remove six screws and pull out the front (upper) chassis assembly.
(Refer to section 6-3-3.)
8. Undo the PCB holder, and open the FP-58 board.
(Refer to section 6-3-3.)
9. Disconnect connector (CN501) on the FP-58 board.
(Refer to section 6-3-3.)
10. Remove two screws, and remove the power switch.
(Refer to section 6-3-3.)
11. Disconnect connector (CN512) on the VR-152 board, connector (CN570) on the SWC-18 board and connector (CN505) on the FP-58 board, and remove the front (upper) chassis assembly.
(Refer to section 6-3-3.)
12. Disconnect connector (CN503), and remove the FP-58 board.
(Refer to section 6-3-3.)
13. Remove the nut of HEADPHONES jack.
14. Remove two screws, and remove the volume bracket.

15. Disconnect two connectors (CN522 and CN523).

16. Remove five nuts and washers, and remove the VR-153 board.

17. Install the VR-153 board in the reverse order of steps 1 through 16.

Note

After installing the nuts, apply locking compound.

6-3-5. KY-231 Board

1. Turn off the power.
2. Remove the lower control panel assembly.
(Refer to section 1-9.)
3. Remove five screws as shown in the figure, and remove the KY protector.

4. Remove six screws as shown in the figure.
5. Disconnect connector (CN592).

6. Install the KY-231 board in the reverse order of steps 1 through 5.

6-3-6. DP-176 Board

1. Turn off the power.
2. Remove the KY-231 board.
(Refer to section 6-3-5.)
3. Unsolder connector (CN591), and remove the DP-176 board.

4. Install the DP-176 board in the reverse order of steps 1 through 3.

6-3-7. SWC-18 Board

1. Turn off the power.
2. Pull out the lower control panel assembly.
(Refer to section 1-8.)
3. Remove two screws, and remove the sub control panel.

4. Remove three screws.
5. Unlock by sliding the SWC-18 board in the direction of the arrow, and remove the board.

6. Disconnect connector (CN570).

7. Install the SWC-18 board in the reverse order of steps 1 through 6.

6-3-8. SWC-19 Board

After replacing this board, RF (digital) system adjustment should be performed.
(Refer to maintenance manual Part 2.)

1. Turn off the power.
2. Remove the lower control panel assembly.
(Refer to section 1-9.)
3. Remove two screws, and remove the system setup panel.

4. Remove four screws, and open the SWC-19 board.

5. Disconnect connector (CN148).

6. Install the SWC-19 board in the reverse order of steps 1 through 5.

6-3-9. CP-218 Board

After replacing this board, analog video input/output level check should be performed.
(Refer to maintenance manual Part 2.)

1. Turn off the power.
2. Remove 12 screws.

3. Remove the connector panel.
(Refer to section 1-2-3.)
4. Remove the duct cover.

5. Remove a screw, and remove the CP-218 board.

Note

At this time, two ornamental plates and two ornamental plate spacers are come off. Do not lose them.

6. Disconnect four connectors (CN412, CN413, CN414 and CN415).

7. Install the CP-218 board in the reverse order of steps 1 through 6.

Note

When installing the duct cover, exercise caution so as not to nip the harness.

6-3-10. CP-220 Board

After replacing this board, analog audio input/output level check should be performed.
(Refer to maintenance manual Part 2.)

1. Turn off the power.
2. Remove the CP-218 board,
(Refer to section 6-3-9.)
3. Remove 20 screws.

4. Remove a screw, and remove the CP-220 board.

Note

At this time, five ornamental plates are come off. Do not lose them.

5. Disconnect five connectors (CN400, CN401, CN402, CN403 and CN404).

6. Install the CP-220 board in the reverse order of steps 1 through 5.

6-3-11.DR-307/200 Board

After replacing this board, servo/DT adjustment should be performed.

(Refer to maintenance manual Part 2.)

1. Turn off the power.
2. Remove the bottom plate.
(Refer to section 1-2-1.)
3. Remove three screws, and remove the BT plate.

4. Disconnect seven connectors (CN302, CN303, CN304, CN305, CN306, CN321 and CN322).
(Refer to section 6-1-3.)

5. Undo the PCB holder, and open the DR-307/200 board.

6. Remove the DR-307/200 board from the rod holder.

7. Install the DR-307/200 board in the reverse order of steps 1 through 6.

Note

When closing the DR-307/200 board, harness of the CN302 should be put in.

6-3-12.DT-34 Board

After replacing this board, DT adjustment should be performed.

(Refer to maintenance manual Part 2.)

1. Turn off the power.
2. Remove the DR-307/200 board.
(Refer to section 6-3-11.)
3. Disconnect two connectors (CN390 and CN391).
4. Remove two screws, and remove the DT-34 board.

5. Install the DT-34 board in the reverse order of steps 1 through 4.

6-3-13.HN-181 Board

1. Turn off the power.
2. Remove the upper lid.
(Refer to section 1-2-1.)
3. Remove the MD plate.
(Refer to section 1-3.)
4. Remove the bottom plate.
(Refer to section 1-2-1.)
5. Remove three screws, and remove the BT plate.

6. Disconnect three connectors (CN302, CN321 and CN322).

7. Undo the PCB holder, and open the DR-307/200 board.

8. Disconnect four connectors (CN212, CN213, CN214 and CN215) on the HN-181 board.

9. Remove three screws, then remove the DR bracket B and DR-307/200 board.

10. Remove the harness cover.

11. Remove two screws, and remove the DT-34 board, then disconnect two connectors (CN208 and CN209).

12. Disconnect nine connectors (CN201, CN202, CN204, CN205, CN210, CN211, CN216, CN217 and CN218) on the HN-181 board.

13. Remove two screws which fix HN-184 board and HN-185 board, and remove two HN brackets each.

14. Disconnect connector (CN203) with care while holding A portion.

15. Disconnect connector (CN241) on the HN-185 board (to protect flexible card wire from damage).
16. Disconnect two connectors (CN206 and CN207) with care while holding B portion.

17. Remove four screws, and remove the HN-181 board.

18. Install the HN-181 board in the reverse order of steps 1 through 17.

6-3-14.HN-184 Board

1. Turn off the power.
2. Remove the upper lid.
(Refer to section 1-2-1.)
3. Remove the MD plate.
(Refer to section 1-3.)
4. Disconnect five connectors (CN231, CN232, CN233, CN234, CN235).

5. Remove the bottom plate.
(Refer to section 1-2-1.)
6. Remove three screws, and remove the BT plate.

7. Undo the PCB holder, and open the DR-307/200 board.

8. Remove two screws, and remove two HN brackets.

9. Disconnect connector (CN203) with care while holding A portion.

10. Remove the HN-184 board.

11. Install the HN-184 board in the reverse order of steps 1 through 10.

6-3-15.HN-185 Board

1. Turn off the power.
2. Remove the upper lid.
(Refer to section 1-2-1.)
3. Remove the MD plate.
(Refer to section 1-3.)
4. Disconnect four connectors (CN241, CN242, CN243 and CN244).

5. Remove a screw, and remove the shield plate.

6. Remove the bottom plate.
(Refer to section 1-2-1.)
7. Remove three screws, and remove the BT plate.

8. Undo the PCB holder, and open the DR-307/200 board.

9. Remove two screws, and remove the DT-34 board, then disconnect two connectors (CN208 and CN209).

10. Remove two screws and two HN brackets.

11. Disconnect two connectors (CN206 and CN207) with care while holding B portion.

12. Remove the HN-185 board.

13. Install the HN-185 board in the reverse order of steps 1 through 12.

6-4. ADJUSTMENT AND CHECK AFTER DIGITAL BOARD REPLACEMENT

After each digital board is replaced, perform adjustment and check which are described in following sections.

- 6-4-1. VPR-1 Board
- 6-4-2. APR-1 Board

As for DIF-16 and DPR-36 boards, no adjustment is needed after replacing the board. Perform operation check only.

6-4-1. VPR-1 Board

[Item List]

How to operate the maintenance mode

Push ⑧ S300(DIAG/ADJUST 1) (M-1) on the SS-52 board to enter the maintenance mode.

How to enter the next menu:

Press the ⑥ JOG button once. (Enters JOG mode.)
Turn the ⑦ search dial to move the * mark to a desired item.
Press the ③ SET button.

How to exit the current menu or the maintenance mode:

Press the ② MENU button.

How to operate a tape (e.g. PLAY) in the manual adjustment or other items:

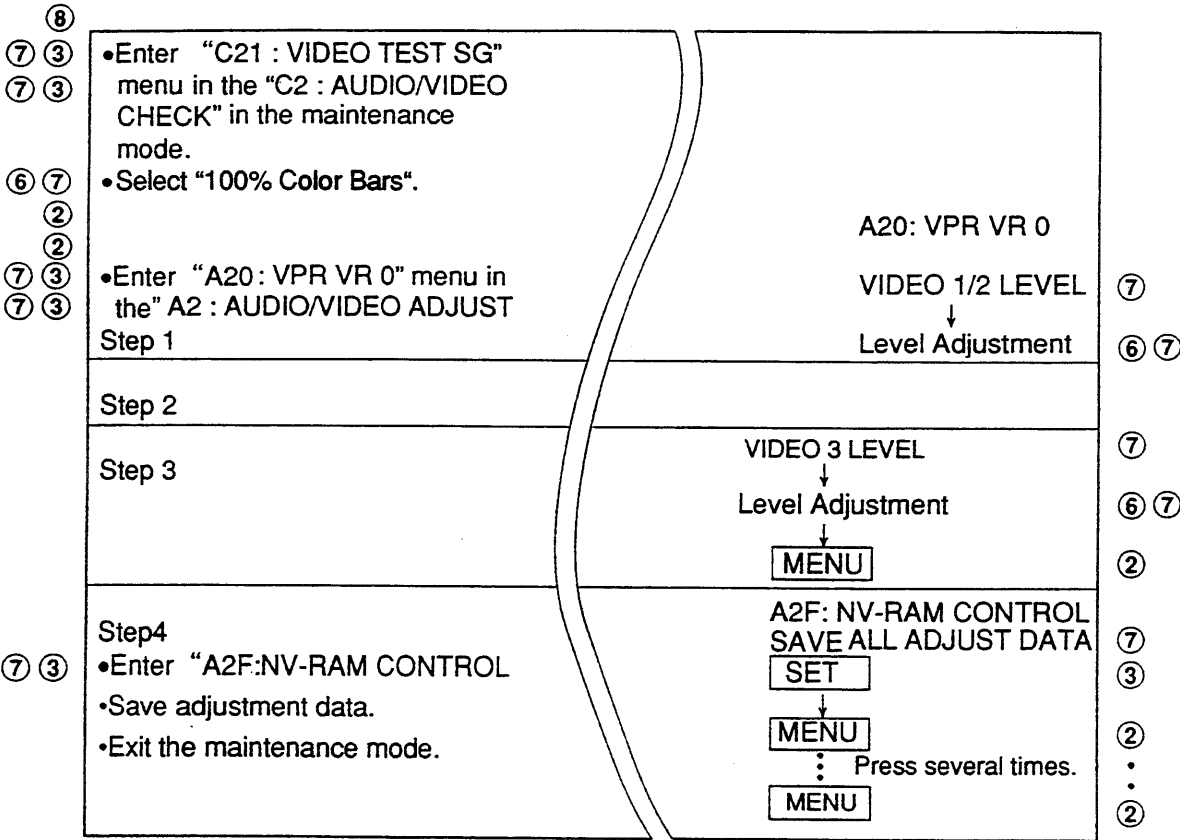

Press the ③ SET button to exit the maintenance mode temporarily. (A tape can be operated in this condition.)
Press the ② MENU button to return to the maintenance mode.

How to change the data (adjust the level) manually:

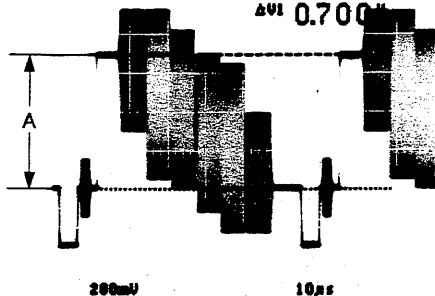

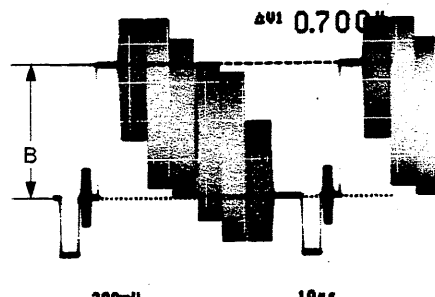

Turn the ⑦ search dial to move the * mark to the item wishing to be adjusted.
Turn the ⑦ search dial while pressing the ⑥ JOG button.

How to save the data:

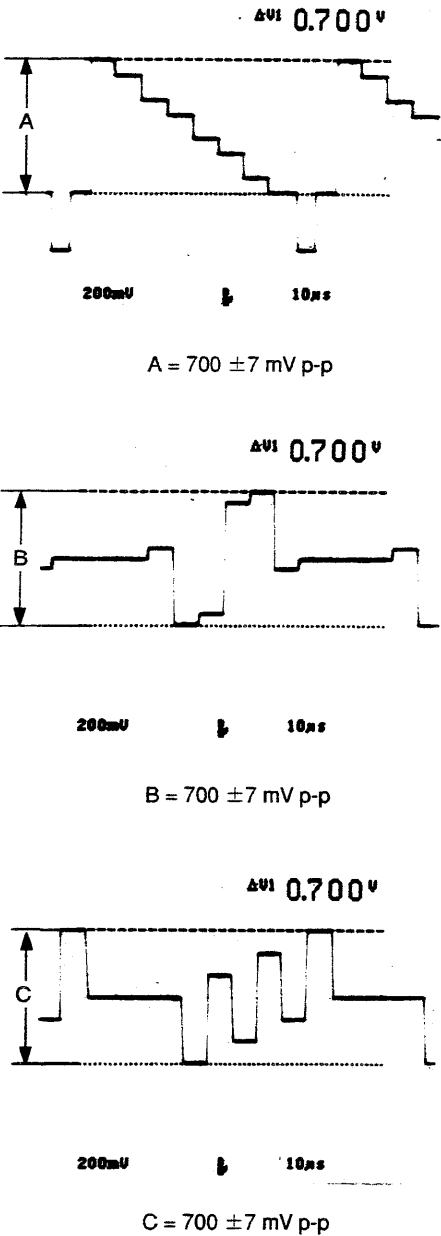

Turn the ⑦ search dial to move the * mark to "A?F: NV-RAM CONTROL".
Press the ③ SET button.
Turn the ⑦ search dial to move the * mark to "SAVE ALL ADJUST DATA".
Press the ③ SET button.

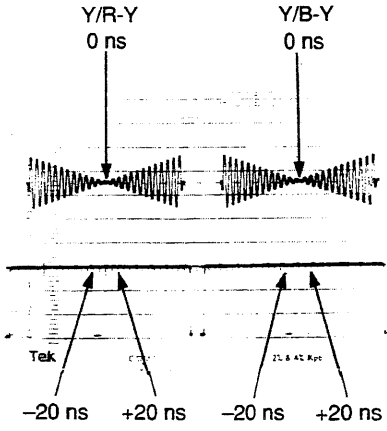

1. Composite Video Output Level Adjustment

Preparations for adjustment	Specifications	Adjustments
<ul style="list-style-type: none"> Enter "C21: VIDEO TEST SG" menu in the "C2: AUDIO/VIDEO CHECK" in the maintenance mode. Select "100% Color Bars". 6-5. ADJUSTMENT AFTER TBC-23 BOARD REPLACEMENT

When the TBC-23 board had been replaced, be sure to perform adjustment in accordance with the board suffix number.

When make a board replacement, ask to Sony service personnel.

SECTION 7

PERIODIC MAINTENANCE AND INSPECTION

7-1. CLEANING

To make the most of the functions, fully realize the performance of this unit, and to lengthen the life of the unit and tape, clean the components often.

7-1-1. General Information for Cleaning

1. Index

〈Mechanical Deck Block〉

〈Cassette Compartment〉

〈Unit〉

2. Cautions

- Turn the power off before cleaning.
- Each block in the mechanical deck consists of a precision part and is adjusted precisely. Be careful not to damage each part and to apply an excessive force during cleaning.
- Do not touch the greased portions during cleaning. If grease attaches to a cleaning cloth, replace the cleaning cloth by new one. If a cleaning cloth smeared with grease is used, grease may attach to the places where it should not.
- Do not insert a cassette tape before a cleaning fluid completely evaporates after cleaning.

3. Preparation

- (1) Turn the power off.
- (2) Remove the upper lid. (Refer to Section 1-2-1.)
- (3) Remove the sound insulation plate (MD). (Refer to Section 1-3.)
- (4) Remove the cassette compartment. (Refer to Section 1-2-2.)

7-1-2. Rotary Heads Cleaning

Caution

The rotary heads are the part that can be damaged easily. Be careful not to damage the rotary heads during cleaning.

Tools

- Cleaning cloth: 3-184-527-01
- Cleaning fluid: 9-919-573-01

Caution

Do not use a cotton swab to clean the rotary heads.

Procedures

1. Loosen the two screws and remove the upper drum cover.

Note: These screws cannot be removed because of stoppers.

2. Hold the cleaning cloth moistened with cleaning fluid keeping it from becoming wrinkled. And press the cleaning cloth slightly against the rotary heads.
3. Rotate the inner drum slowly counterclockwise two or three turns and clean the rotary heads with the cleaning cloth held.

Caution

Be sure to rotate the inner drum counterclockwise and clean the rotary heads along the circumference. Do not rotate the inner drum in the direction opposite to the specified direction (clockwise) or clean it in the vertical direction. This may damage the rotary heads and the brush/slip ring assembly.

4. After cleaning, wipe it with a dry cleaning cloth two or three times.
5. Tighten the two screws while pressing the upper drum cover towards the drum support direction.

Tightening torque: $14.7 \times 10^{-2} \text{ N} \cdot \text{m}$ (1.5 kgf·cm)

7-1-3. Upper Drum's Tape Running Surface Cleaning

Caution

Be careful not to damage the upper drum during cleaning. Pay careful attention when cleaning the edge portion below the upper drum because it is located near the rotary heads.

Tools

- Cleaning cloth: 3-184-527-01
- Cleaning fluid: 9-919-573-01

Procedures

1. Press the cleaning cloth moistened with a cleaning fluid slightly against the upper drum's tape running surface (shaded portion in the figure).
2. Clean the upper drum's tape running surface along the circumference two or three times.

Caution

Pay careful attention when cleaning the edge portion below the upper drum.

3. After cleaning, wipe it with a dry cleaning cloth two or three times.

7-1-4. Lower Drum's Tape Running Surface and Lead Surface Cleaning

Caution

Be careful not to damage the lower drum (specially lead surface) during cleaning. Pay careful attention when cleaning the edge portion above the lower drum because it is located near the rotary heads.

Tools

- Cleaning cloth: 3-184-527-01
- Cleaning fluid: 9-919-573-01
- Skewer or an equivalent (A metallic skewer cannot be used.)

Procedures

1. As shown in the figure, put a skewer (or an equivalent) along the drum lead surface and remove the magnetic powder.

Caution

1. Do not use a metallic skewer instead of the skewer. This may damage the tape running surface.
2. Tracking may be badly influenced when magnetic powder attaches to the drum lead surface. Remove the magnetic powder completely during cleaning.
2. Clean the drum lead surface and lower drum's tape running surface (shaded portion in the figure) with a cleaning cloth moistened with a cleaning fluid.
3. After cleaning, wipe it with a dry cleaning cloth two or three times.

7-1-5. Stationary Heads Cleaning

Cautions

- Be careful not to damage the head surface when cleaning the stationary heads.
- The full erase head is not installed in a player.

Tools

- Cleaning cloth: 3-184-527-01
- Cleaning fluid: 9-919-573-01

Procedures

1. Clean the tape running surfaces of the audio/TC head, CTL head, and full erase head in the vertical direction with a cleaning cloth moistened with a cleaning fluid.

Caution

An error may occur in the recording or playback when magnetic powder attaches to the head gap portion of the audio/TC head, CTL head, and full erase head. Remove the magnetic powder completely during cleaning.

2. After cleaning, wipe it with a dry cleaning cloth two or three times.

7-1-6. Tape Running System and Tape Cleaner Cleaning

Warning

The tape cleaner has a sharp edge. Do not touch the edge with bare hands. Pay careful attention when cleaning the tape cleaner.

Tools

- Cleaning cloth: 3-184-527-01
- Cleaning fluid: 9-919-573-01

Procedures

1. Pass a piece of paper approximately this manual's paper thick through the clearance of the tape cleaner from top to bottom four or five times.
At this time, do not move the paper from bottom to top.
2. Clean the tape running surfaces (shaded portions in the figure) of each guide with cleaning cloth moistened with a cleaning fluid.
3. After cleaning, clean it with a dry cleaning cloth two or three times.

Warning

Do not touch the edge portion of the tape cleaner with bare hands.

7-1-7. Fan Motor Cleaning

Caution

The temperature in the unit increases when dust attaches to the fan motor and when the air flow is disturbed. This may badly influence the performance and life of the unit. Clean the fan motor on the rear panel periodically because it accumulates dust easily.

Tools

- Cleaning cloth: 3-178-770-01
- Cleaning fluid: 9-919-573-01
- Vacuum cleaner

Procedures

1. Remove the power panel. (Refer to Section 1-2-1.)
2. Remove the connector panel. (Refer to Section 1-2-3.)
3. Remove the dust on the fan motors using a vacuum cleaner.
4. Clean the fin (shaded portion in the figure) with cleaning cloth moistened with cleaning fluid.
5. Install the connector panel. (Refer to Section 1-2-3.)
6. Install the power panel. (Refer to Section 1-2-1.)

7-1-8. Cassette Compartment Cleaning

Cautions

- Be careful not to apply an excessive force to the compartment or the mirror when cleaning the cassette compartment.
- Do not clean the door and the mirror with alcohol. This may cause a crack.

Tools

- Cloth (or Gauze)
- Vacuum cleaner

Procedures

1. Remove the cassette compartment from the unit. (Refer to Section 1-2-2.)
2. Remove the dust on the cassette compartment from the cassette insertion inlet using a vacuum cleaner.
3. Clean the compartment (shaded portion in the figure) with a dry cloth (or gauze).

Caution

Do not apply an excessive force to the compartment block.

7-2. PERIODIC CHECK

To make the most of the functions, fully realize performance of the unit, lengthen the life of the unit and tape, a periodic check is recommended.

7-2-1. Hours Meter

This unit can display an hours meter on the time counter display of the upper control panel or on the monitor connected to this unit. Perform a periodic check with this hours meter as a reference.

1. Display procedure

Refer to Section 1-10-2 in Installation Manual.

2. Contents of display

SET-UP MENU	DESCRIPTION	TIME COUNTER DISPLAY	MONITOR DISPLAY
H01: OPERATION HOURS	Accumulated hours when the power of the unit is on	Display the time by ten hours. ^(Note)	Display the time by an hour.
H02: DRUM RUNNING HOURS	Accumulated hours when the drum rotates in the threading end state	Display the time by ten hours. ^(Note)	Display the time by an hour.
H03: TAPE RUNNING HOURS	Accumulated hours when the tape runs in the F. FWD, REW, PLAY, SEARCH, REC and EDIT modes (not including STILL mode)	Display the time by ten hours. ^(Note)	Display the time by an hour.
H04: THREADING COUNTER	Accumulated number of threading and unthreading times	Display the number by ten times. ^(Note)	Display the actual number

(Note) While pressing the JOG or SHUTTLE button on the lower control panel, display the time by an hour (or display the actual number).

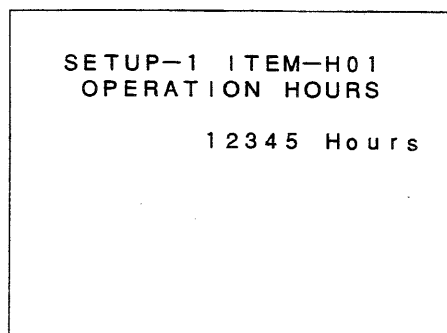

〈Example〉

In a case of the total hours that the power of the unit has been turned on is 12,345 hours:

• Time Counter Display

• Monitor Display

7-2-2. Periodic Check List

The replacement time shown in the table below is not the guarantee term of parts. Use this table as guidelines for maintenance and inspection. The replacement time of parts varies depending on the operating environment and conditions of the unit.

To maintain the steady performance, it is recommended to clean the tape running system and perform the RF system automatic adjustment every the following hours as a guide.

- every 50 hours (H02): Cleaning by cleaning tape (Refer to Section 1-11-1.)
- every 200 hours (H02): Perform the cleaning as the following procedure.
 1. Cleaning by cleaning tape (Refer to Section 1-11-1.)
 2. Cleaning by cleaning cloth (Refer to Section 7-1-2 through 7-1-6.)
- every 500 hours (H02): Execute the following automatic adjustment. (Refer to Section 5-8.)
 - A12: ADV EQUALIZER
 - A13: CONF EQUALIZER
 - A18: REC CURRENT

Note: The part marked with “↓” in the table is replaced simultaneously with when the part in the column below its mark is replaced.

☆ : Replace the part.

◇ : Perform check (adjustment).

No.	Item	Menu No.	Inspection Hours (h)						Replacement Parts

(Note 1) In an environmental condition of high humidity and excessive dust to operate the unit, it may cause in shortening the life of the heads.

Therefore, it is recommended to use the unit in an air-conditioned place at middle temperature and humidity of the specifications, and lesser dust circumstances. In addition, the tapes should be kept in the same conditions.

(Note 2) ◇: Adjust the audio frequency response. (Refer to Section 8-7.)

(Note 3) Replace the pinch solenoid when the replacement time or count is reached whichever is earlier.

(Note 4) It is recommended to replace the CR spacer (3-182-765-) at the same time.

CASSETTE COMPARTMENT ASSEMBLY

SECTION 8

REPLACEMENT OF PERIODIC MAINTENANCE PARTS

8-1. GENERAL INFORMATION FOR PARTS REPLACEMENT AND ADJUSTMENT

8-1-1. Basic Knowledge

1. Tape Cleaner

Never touch the edge of the tape cleaner with bare hands.

It is in danger of cutting your finger because the tape cleaner has a sharp edge.

Pay careful attention when replacing or adjusting the peripheral parts.

2. Tools

- Clean the surface of the tool with a cleaning cloth moistened with cleaning fluid before use it.
 - Cleaning cloth: 3-184-527-01
 - Cleaning fluid: 9-919-573-01
- Be careful not to damage the tool. If the flawed tool is used, adjustment cannot be performed correctly.

8-1-2. Threading End Mode and Unthreading End Mode

1. Threading End Mode

Threading end mode means that the threading ring rotates in the counterclockwise direction, then stops.

There are three ways of putting the unit into the threading end mode without installing the cassette compartment.

Method ①: Turn the power on.

Method ②: Press the STOP button in power on state.

Method ③: Turn the M gear of the gear box assembly in the direction of the arrow A.

Threading End Mode

2. Unthreading End Mode

Unthreading end mode means that the threading ring rotates in the clockwise direction, then stops. (It is same state with EJECT completion mode.)

There are two ways of putting the unit into the unthreading end mode without installing the cassette compartment.

Method ①: Press the EJECT button in threading end mode.

Method ②: Turn the M gear of the gear box assembly in the direction of the arrow B.

Unthreading End Mode

8-1-3. L Cassette Position and S Cassette Position

1. L Cassette Position

L cassette position means that the reel tables are in the position of L cassette tape.

There are two ways of putting the reel tables into the L cassette position without installing the cassette compartment.

Method ①: Press the switch S700 (C-1/side A) on the SS-52 board in power on state.

Method ②: Turn the drive gear in the direction of the arrow C.

2. S Cassette Position

S cassette position means that the reel tables are in the position of S cassette tape.

There are two ways of putting the reel tables into the S cassette position without installing the cassette compartment.

Method ①: Press the switch S700 (C-1/side A) on the SS-52 board in power on state.

Method ②: Turn the drive gear in the direction of the arrow D.

8-2. PARTS REPLACEMENT

1. Index

〈Mechanical Deck Block〉

No.	Part Name	Page
1	Inner Drum Assembly	8-10
2	Brush/slip ring Assembly	8-24
3	Drum Assembly	8-26
4	Rotary Head Cleaner Assembly	8-32
5	AT Head Cleaner	8-34
7	Pinch Roller	8-38

No.	Part Name	Page

No.	Part Name	Page
14	Fan Motor	8-69

No.	Part Name	Page
15	Filter	8-70

2. Note

(1) Grease and Oil

- Please use only the specified grease and oil.
If the different grease or oil is used, major malfunctions may be caused due to differences in viscosity and ingredients.
And if the grease or oil is used that has been mixed with dust, major malfunctions may be caused.
Please use the following grease and oil.
 - Grease (SGL-505): 7-662-010-04
 - Oil: 7-661-018-18
- Smear just enough grease to create a thin film on the surface of the part.
Any grease that adheres to other surrounding parts must be wipe with gauze or soft cloth.
- A drop of oil is defined as follows:
About the amount that will adhere to the end of a stick 2 mm in diameter, as shown in the figure.
- Do not use the grease and oil except for specified portions.

Oil

(2) Stop Washer

It should not be used the stop washer once and again.

- Stop washer (d=2.3 mm): 3-669-596-00

3. Preparation

(1) When replacing parts on the upper surface of the mechanical deck

- except DVW-CA510P/CA510
 - ① Turn the power off.
 - ② Remove the upper lid. (Refer to Section 1-2-1.)
 - ③ Remove the plate MD. (Refer to Section 1-3.)
 - ④ Remove the cassette compartment. (Refer to Section 1-2-2.)
- DVW-CA510P/CA510
 - ① Turn the power off.
 - ② Remove the upper lid. (Refer to Section 1-3-1.)
 - ③ Remove the ejector assembly. (Refer to Section 1-4.)
 - ④ Remove the cassette compartment. (Refer to Section 1-3-2.)

(2) When replacing parts on the bottom surface of the mechanical deck

- except DVW-CA510P/CA510
 - ① Turn the power off.
 - ② Remove the upper lid. (Refer to Section 1-2-1.)
 - ③ Remove the plate MD. (Refer to Section 1-3.)
 - ④ Remove the cassette compartment. (Refer to Section 1-2-2.)
 - ⑤ Remove the bottom plate. (Refer to Section 1-2-1.)
 - ⑥ Remove the plate BT.
- DVW-CA510P/CA510
 - ① Turn the power off.
 - ② Remove the upper lid. (Refer to Section 1-3-1.)
 - ③ Remove the ejector assembly. (Refer to Section 1-4.)
 - ④ Remove the cassette compartment. (Refer to Section 1-3-2.)
 - ⑤ Remove the bottom plate. (Refer to Section 1-3-1.)
 - ⑥ Remove the plate BT.

8-2-1. Inner Drum Assembly Replacement

Outline

Replacement
1. Remove the Rotary Head Cleaner Assembly
2. Remove the Upper Drum Cover
3. Disconnect the Flexible Board (CN241/HN-185 Board)
4. Remove the Brush/Slip Ring Assembly
5. Remove the Upper Drum Assembly
6. Remove the Inner Drum Assembly
7. Cleaning (Inner Drum Assembly Mounting Surface, Drum Support Mounting Surface, Lower Drum Flange Surface, Tape Running Surface, Lead Surface, and Contacting Points)
8. Install the Inner Drum Assembly
9. Install the Upper Drum Eccentricity Adjustment Tool
10. Adjust the Inner Drum Eccentricity
11. Remove the Upper Drum Eccentricity Adjustment Tool
12. Cleaning (Height Determining Plate's Lower Surface, Drum Support's Upper Surface, and Upper Drum Contacting Surface)
13. Install the Upper Drum Assembly
14. Cleaning (DR-205 Board's Contacting Points and Brush/Slip Ring Assembly Mounting Surface)
15. Install the Brush/Slip Ring Assembly
16. Connect the Flexible Board (CN241/HN-185 Board)
17. Cleaning (Rotary Heads and Upper Drum's Tape Running Surface)
18. Install the Upper Drum Cover
19. Install the Rotary Head Cleaner Assembly
Adjustment after Replacement
20. Confirm the Tape Running (Refer to Section 8-4-2.)
21. Confirm the Video Tracking (Refer to Section 8-4-3.)
22. Confirm the CTL Head Height (Refer to Section 8-4-4.)
23. Adjust the CTL Head Position (Refer to Section 8-4-5.)
24. Confirm the Audio/TC Head Height (Refer to Section 8-4-6.)
25. Adjust the Audio/TC Head Position (Refer to Section 8-4-9.)
26. Perform the Servo/DT and RF Adjustment (Refer to Section 8-5.)
27. Perform the Adjustment after Drum Replacement (Refer to Section 8-6.)

Note

When the rotary head tip was worn or damaged, replace the inner drum assembly. It cannot be replaced only head tip.

Basic Knowledge

For except the periodic replacement time, replace the inner drum assembly in the following case.

- A correct RF signal waveform cannot be obtained even if the tracking adjustment is performed.

Tools

- Hexagonal wrench driver (2.5 mm): 7-700-766-04
- Torque screwdriver (6 kg•cm)(JB-5251): J-6252-510-A
- Torque screwdriver (12 kg•cm)(JB-5252): J-6252-520-A
- Torque screwdriver's bit (+ 2 mm, l=75 mm): J-6323-420-A
- Torque screwdriver's hexagonal bit (d=2.5 mm, l=120 mm): J-6251-090-A

- Cleaning cloth: 3-184-527-01
- Cleaning fluid: 9-919-573-01

- Upper drum eccentricity adjustment tool (1): J-6001-840-A
- or upper drum eccentricity adjustment tool (6): J-6325-530-A
- Upper drum eccentricity adjustment tool (2): J-6001-830-A
- Upper drum eccentricity adjustment tool (3): J-6001-820-A
- Upper drum eccentricity adjustment tool (5): J-6087-000-A

Note1: The eccentricity adjustment tool is named an "upper drum eccentricity adjustment tool" in this case. In this unit, the eccentricity value of the inner drum is measured.

Note2: The upper drum eccentricity adjustment tool is assembled for use as shown in the figure.

Note3: The following tool is able to use instead of using the upper drum eccentricity adjustment tool (3) and (5).

- Upper drum eccentricity adjustment tool (7): J-6324-030-A

Upper drum eccentricity adjustment tool

Removal

1. Remove the Rotary Head Cleaner Assembly

- (1) Disconnect the connector from connector CN232 on the HN-184 board.
- (2) Cut the harness clasper.
- (3) Remove the harness from the sensor holder.
- (4) Remove the screw, shift the rotary head cleaner assembly in the direction indicated by the arrow A, and remove it from the drum support.

Remove the Rotary Head Cleaner Assembly

2. Remove the Upper Drum Cover

Loosen the two screws and remove the upper drum cover.

Note: These screws cannot be removed because of stoppers.

Remove the Upper Drum Cover

3. Disconnect the Flexible Board

Disconnect the flexible board from connector CN241 on the HN-185 board.

4. Remove the Brush/Slip Ring Assembly

Remove the two screws, then remove the brush/slip ring assembly.

Caution

1. Do not apply excessive force to the brush/slip ring assembly at that time.
2. If the screws remain put into the screw holes of the brush/slip ring assembly, remove them once. When the brush/slip ring assembly is turned upside down, these screws may be dropped into the slip ring cover.

Remove the Brush/Slip Ring Assembly

5. Remove the Upper Drum Assembly

- (1) Rotate the knob manually by about seven turns, then loosen.
- (2) Remove the two screws using a hexagonal wrench driver.
- (3) Raise the upper drum assembly just above, then remove.

Caution

1. Be careful not to damage the tape running surface and the contacting surface (shaded portion in the figure) of the upper drum when removing the upper drum assembly. Also, take care not to damage the lower edge portion of the upper drum.
2. Be sure to put the removed upper drum assembly with the upper surface (on which the height determining plate is installed) down. If not, the edge portion may be damaged.
3. Be careful not to damage the drum support mounting surface and lower drum's upper edge portion after the upper drum assembly was removed.

Remove the Upper Drum Assembly

6. Remove the Inner Drum Assembly

- (1) Insert the hexagonal wrench driver from the screw hole and loosen the screw fully.

Note: The inner drum assembly is fixed with the four fixing screws (C3x12) in the screw holes. These screws cannot be removed because of stoppers.

- (2) Remove the inner drum assembly while inclining it as shown in the figure.

Caution

Be careful not to damage the upper drum contacting surface of the drum support.

Remove the Inner Drum Assembly

Installation

Caution

The inner drum assembly for repair has an inner drum cover. This cover is provided to protect the rotary heads. Do not remove the inner drum cover until the inner drum assembly has been installed.

7. Cleaning

- (1) Clean the portion below with a cleaning cloth moistened with cleaning fluid.
 - New inner drum assembly mounting surface (shaded portion shown in the figure)
 - Drum support's upper drum mounting surface (shaded portion shown in the figure)
 - Lower drum flanges (shaded portion shown in the figure) and edge portion
 - Lower drum's tape running surface and lead portion (Refer to Section 7-1-4.)

Caution

After cleaning, wipe with a dry cleaning cloth.

- (2) Wipe the portion below with a dry cleaning cloth.
 - Lower drum's contacting points

Caution

Do not apply cleaning fluid to the contacting points.

Cleaning

8. Install the Inner Drum Assembly

When installing the inner drum assembly in the unit with an analog playback function, be sure to check the following items.

Before installing the inner drum assembly

- Loosen the knob (a) sufficiently. (Fig. 2)

Caution

Be careful not to drop the knob (a).

- Loosen the screw (b) about 1.5 turns. (Fig. 2)

After installing the inner drum assembly

- Tighten the screw (b) about 1.5 turns.

- (1) Place the hole (A) on the positioning pin side on DR-202 board into the center position of the drum support.

Caution

At this time, be careful not to touch the contacting points and flanges.

- (2) Align the hole (A) on the positioning pin side on DR-202 board with positioning hole (B) on the inner drum cover. (Fig. 1)
- (3) Put the inner drum assembly on the lower drum gently in the slanting direction with care not to touch the drum support. (Fig. 2)

Caution

1. Do not hold the claws of the inner drum cover when installing the inner drum assembly.
2. Be careful not to touch the audio/TC head, peripheral tape guides and drum support when installing the inner drum assembly.
3. Do not turn the inner drum while the inner drum cover is installed.
- (4) Tighten the four screws (C3×12) tentatively and equally while pushing the inner drum downward.
- (5) Press the claws of the inner drum cover in the direction indicated by the arrow and raise the inner drum cover up, then remove it. (Fig. 3)

(Fig.1)

(Fig.2)

• Remove the Inner Drum Cover

(Fig.3)

Install the Inner Drum Assembly

9. Install the Upper Drum Eccentricity Adjustment Tool

- (1) Clean the measuring probe and the inner drum portion shown in the figure (the circumference) with a cleaning cloth moistened with cleaning fluid.

Caution

Do not make dirt adhere to the measuring probe during use. This may damage the inner drum.

- (2) Install the eccentricity adjustment tool in the chassis shown in the figure.

Install the Upper Drum Eccentricity Adjustment Tool

10. Adjust the Inner Drum Eccentricity

- (1) Set the measuring probe of the tool to the inner drum portion shown in the figure.

Caution

Take care that the measuring probe does not touch the rotary heads.

- (2) Rotate the inner drum slowly clockwise.

Note: The inner drum is rotated clockwise for measuring the eccentricity value. When the brush/slip ring is installed, do not rotate the inner drum clockwise.

Confirm that the pointer deviation of the gauge satisfies the specification in one complete turn of the inner drum.

If the specification is not satisfied, repeat steps ① to ③ below until it is satisfied.

- ① Rotate the inner drum slowly clockwise and stop the rotation in the position where the pointer deviation is minimum.
- ② Push the board cover in the position opposite to the measuring probe by 180 degrees toward the direction of the arrow so that the pointer deviation is 1/2 of the maximum value.
- ③ Confirm that the specification is satisfied.

Note: When the pointer does not move even if the board cover is pushed by finger, tighten the four screws fixing the inner drum a little loosely. When the pointer moves immediately, tighten the screws a little firmly.

- (3) Tighten the four screws gradually in the order indicated in the board cover.

Tightening torque: $39.2 \times 10^{-2} \text{ N} \cdot \text{m}$
(4 kgf·cm)

- (4) Confirm that the pointer deviation of the gauge satisfies the specification.

If the specification is not satisfied, loosen the four screws once. Then perform steps ① to ③ above.

- (5) Tighten the four screws gradually in the order indicated in the board cover.

Tightening torque: $78.4 \times 10^{-2} \text{ N} \cdot \text{m}$
(8 kgf·cm)

- (6) Confirm again that the pointer deviation of the gauge satisfies the specification.

11. Remove the Upper Drum Eccentricity Adjustment Tool

Adjust the Inner Drum Eccentricity

12. Cleaning

Clean the lower surface (shaded portion in the figure) of the height determining plate, the upper surface of the drum support (shaded portion in the figure), and the upper drum contacting surface with a cleaning cloth moistened with cleaning fluid.

Caution

After cleaning, wipe with a dry cleaning cloth.

Cleaning

13. Install the Upper Drum Assembly

- (1) Install the upper drum assembly slowly so that the leaf spring is put into the hole of the height determining plate.

Caution

Take care that the tape running surface and the contacting surface (shaded portion in the figure) of the upper drum does not strike against the drum support. Also, be careful not to damage the lower edge portion of the upper drum.

- (2) Tighten the two screws each by three turns.
- (3) Tighten the knob. At that time, confirm that the portion B of the upper drum assembly somewhat rises to the surface.
- (4) Tighten the two screws alternately and gradually.

Tightening torque: $78.4 \times 10^{-2} \text{ N} \cdot \text{m}$
(8 kgf·cm)

- (5) Confirm that there is no clearance between the drum support and the upper drum assembly (A portion in the figure, both of left and right sides) as visual.

Install the Upper Drum Assembly

14. Cleaning

Wipe the brush/slip ring assembly mounting surface (shaded portion in the figure) and the DR-205 board contacting points with a dry cleaning cloth.

Caution

1. Do not apply cleaning fluid to the contacting points.
2. If the screws remain put into the screw holes of the brush/slip ring assembly, remove them once. When the brush/slip ring assembly is turned upside down, these screws may be dropped into the slip ring cover.

Cleaning

15. Install the Brush/Slip Ring Assembly

- (1) Install the brush/slip ring assembly in the direction shown in the figure.
- (2) Tighten the two screws alternately and gradually while pushing both sides of the flange equally from above.

Tightening torque: $14.7 \times 10^{-2} \text{ N} \cdot \text{m}$
(1.5 kgf·cm)

Caution

Never apply excessive force to the cover.

16. Connect the Flexible Board

Connect the flexible board into connector CN241 on the HN-185 board.

Install the Brush/Slip Ring Assembly

17. Cleaning

Clean the portion below.

- (1) Rotary heads (Refer to Section 7-1-2.)
- (2) Upper drum's tape running surface (Refer to Section 7-1-3.)

Caution

After cleaning, wipe with a dry cleaning cloth.

18. Install the Upper Drum Cover

- (1) Tighten the two screws while pushing the upper drum cover in the direction of the drum support.

Tightening torque: $14.7 \times 10^{-2} \text{ N}\cdot\text{m}$
(1.5 kgf·cm)

- (2) Confirm that the rubber of the upper drum cover does not turn over.
- (3) Confirm that there is no clearance between the upper drum cover and the upper drum.

Install the Upper Drum Cover

19. Install the Rotary Head Cleaner Assembly

- (1) Insert the cleaning roller from the clearance between the drum support and full erase head as shown in the figure.
- (2) Align the two pins of the rotary head cleaner assembly with the two holes of the drum support.
- (3) Tighten the screw while moving the rotary head cleaner assembly in the direction indicated by the arrow A.
- (4) Fix the harness to the sensor holder position shown in the figure.
- (5) Connect a connector into connector CN232 on the HN-184 board.
- (6) Bind the full erase head harness and the rotary head cleaner harness with the harness clumper (or the equivalent).

Install the Rotary Head Cleaner Assembly

Adjustment after Replacement

- 20. Confirm the Tape Running
Refer to Section 8-4-2.
- 21. Confirm the Video Tracking
Refer to Section 8-4-3.
- 22. Confirm the CTL Head Height
Refer to Section 8-4-4.
- 23. Adjust the CTL Head Position
Refer to Section 8-4-5.
- 24. Confirm the Audio/TC Head Height
Refer to Section 8-4-6.
- 25. Adjust the Audio/TC Head Position
Refer to Section 8-4-9.
- 26. Perform the Servo/DT and RF Adjustment
Refer to Section 8-5.
- 27. Perform the Adjustment after Drum Replacement
Refer to Section 8-6.

8-2-2. Brush/Slip Ring Assembly Replacement

Outline

Replacement
1. Remove the Upper Drum Cover
2. Disconnect the Flexible Board (CN241/HN-185 Board)
3. Remove the Brush/Slip Ring Assembly
4. Cleaning (DR-205 Board's Contacting Points and Brush/Slip Ring Assembly Mounting Surface)
5. Install the Brush/Slip Ring Assembly
6. Connect the Flexible Board (CN241/HN-185 Board)
7. Install the Upper Drum Cover
Adjustment after Replacement
8. Perform the Servo/DT Check (Refer to Section 5-2.) (C05: DIGITAL DT CHECK, C06: ANALOG DT CHECK)
9. Perform the RF Check (Refer to Section 5-3.) (C1: RF CHECK)

Note

When the brush or slip ring was worn or damaged, replace the brush/slip ring assembly. It cannot be replaced only brush or slip ring.

Tools

- Torque screwdriver (6 kg·cm) (JB-5251): J-6252-510-A
- Torque screwdriver's bit (+2 mm, l=75 mm): J-6323-420-A
- Cleaning cloth: 3-184-527-01
- Cleaning fluid: 9-919-573-01

Removal

1. **Remove the Upper Drum Cover**
Loosen the two screws and remove the upper drum cover.

Note: These screws cannot be removed because of stoppers.

Remove the Upper Drum Cover

2. **Disconnect the Flexible Board**
Disconnect the flexible board from connector CN241 on the HN-185 board.

3. **Remove the Brush/Slip Ring Assembly**
(1) Remove the two screws, then remove the brush/slip ring assembly.

Caution

Do not apply excessive force to the brush/slip ring assembly at that time.

- (2) Turn the brush/slip ring assembly upside down, and take out the two screws.

Caution

Be careful not to drop the screw into the cover.

Remove the Brush/Slip Ring Assembly

Installation

4. Cleaning

Wipe the brush/slip ring assembly mounting surface (shaded portion in the figure) and the DR-205 board contacting points with a dry cleaning cloth.

Caution

Do not apply cleaning fluid to the contacting points.

• Brush/Slip ring Assembly

• DR-205 Board

CONTACTING POINTS
(Wipe with a dry cleaning cloth.)

Cleaning

5. Install the Brush/Slip Ring Assembly

- (1) Insert the two screws taken out in (2) of step 3 into the screw holes of the brush/slip ring assembly.
- (2) Install the brush/slip ring assembly in the direction shown in the figure.
- (3) Tighten the two screws alternately and gradually while pushing both sides of the flange equally from above.

Tightening torque: $14.7 \times 10^{-2} \text{ N}\cdot\text{m}$
(1.5 kgf·cm)

Caution

Never apply excessive force to the cover.

6. Connect the Flexible Board

Connect the flexible board into connector CN241 on the HN-185 board.

Install the Brush/Slip Ring Assembly

7. Install the Upper Drum Cover

- (1) Tighten the two screws while pushing the upper drum cover in the direction of the drum support.

Tightening torque: $14.7 \times 10^{-2} \text{ N}\cdot\text{m}$
(1.5 kgf·cm)

- (2) Confirm that the rubber of the upper drum cover does not turn over.
- (3) Confirm that there is no clearance between the upper drum cover and the upper drum.

Install the Upper Drum Cover

Adjustment after Replacement

8. Perform the Servo/DT Check

Refer to Section 5-2.
(C05: DIGITAL DT CHECK,
C06: ANALOG DT CHECK)

9. Perform the RF Check

Refer to Section 5-2.
(C1: RF CHECK)

8-2-3. Drum Assembly Replacement

Outline

Replacement
1. Remove the Rotary Head Cleaner Assembly
2. Remove the Upper Drum Cover
3. Disconnect the Flexible Board (CN241/NH-185 Board)
4. Remove the Drum Assembly
5. Cleaning (Drum Assembly Mounting Surfaces and Chassis Mounting Surfaces)
6. Install the Drum Assembly
7. Connect the Flexible Board (CN241/HN-185 Board)
8. Cleaning (Rotary Heads, Upper Drum's Tape Running Surface, and Lower Drum's Tape Running Surface)
9. Install the Upper Drum Cover
10. Install the Rotary Head Cleaner Assembly
Adjustment after Replacement
11. Confirm the Drum Motor Operation (Refer to Section 5-2.) (C015 : DRUM MOTOR)
12. Adjust the Tape Running (Refer to Section 8-4-2.)
13. Adjust the Video Tracking (Refer to Section 8-4-3.)
14. Adjust the CTL Head Height (Refer to Section 8-4-4.)
15. Adjust the CTL Head Position (Refer to Section 8-4-5.)
16. Adjust the Audio/TC Head Height (Refer to Section 8-4-6.)
17. Adjust the Audio/TC Head Azimuth (Refer to Section 8-4-7.)
18. Confirm the Audio/TC Head Head-to-Tape Contact (Refer to Section 8-4-8.)
19. Adjust the Audio/TC Head Position (Refer to Section 8-4-9.)
20. Confirm the Audio Level in REV Mode (Refer to Section 8-4-10.)
21. Confirm the Tape Running (Refer to Section 8-4-2.)
22. Perfrom the Servo/DT and RF Adjustment (Refer to Section 8-5.)
23. Perfrom the Adjustment after Drum Replacement (Refer to Section 8-6.)

Note

Be careful not to damage the audio/TC head and peripheral tape guides when removing or installing the drum assembly.

Basic knowledge

For except the periodic replacement time, replace the drum assembly in the following cases.

- The upper or lower drum's tape running surface is damaged and cannot be repaired.
- A correct RF signal waveform cannot be obtained due to the worn upper or lower drum even if the tracking adjustment is performed.
- The VTR performance deteriorates because of the noise or jitter caused by the bearing life.

Tools

- Hexagonal wrench driver (2.5 mm): 7-700-766-04
- Torque screwdriver (6 kg•cm)(JB-5251): J-6252-510-A
- Torque screwdriver (12 kg•cm)(JB-5252): J-6252-520-A
- Torque screwdriver's hexagonal bit (d=2.5 mm, l=120 mm): J-6251-090-A
- Cleaning cloth: 3-184-527-01
- Cleaning fluid: 9-919-573-01

Removal

1. Remove the Rotary Head Cleaner Assembly

- (1) Disconnect the connector from connector CN232 on the HN-184 board.
- (2) Cut the harness clasper.
- (3) Remove the harness from the sensor holder.
- (4) Remove the screw, shift the rotary head cleaner assembly in the direction indicated by the arrow A, and remove it from the drum support.

Remove the Rotary Head Cleaner Assembly

2. Remove the Upper Drum Cover

Loosen the two screws and remove the upper drum cover.

Note: These screws cannot be removed because of stoppers.

Remove the Upper Drum Cover

3. Disconnect the Flexible Board

Disconnect the flexible board from connector CN241 on the HN-185 board.

4. Remove the Drum Assembly

- (1) Disconnect the connector on the harness rail.

Caution

Only the unit applied to the following serial number:

- DVW-A500P (EK): S/N 12036 and higher
- DVW-A510P (EK): S/N 10721 and higher
- DVW-CA510P (EK): S/N 10051 and higher
- DVW-A500 (UC): S/N 11288 and higher
- DVW-A510 (UC): S/N 10257 and higher
- DVW-CA510 (UC): S/N 10010 and higher

- (2) Rotate the inner drum assembly manually counterclockwise and align mark "⇒" indicated on the board cover with the screw hole of the upper drum assembly.

Note: The drum assembly is fixed to the chassis with the three fixing screws (C3×8) in the screw hole. The screw hole of the upper drum assembly coincides with the fixing screw position by aligning it with mark "⇒" on the board cover.

- (3) Loosen the screw fully using a hexagonal wrench driver.

Note: These screws cannot be removed because of stoppers.

- (4) Loosen other two screws fully in the same way as in steps (2) and (3).

• When removing the connector of the demagnetization head assembly (Only DVW-A500P/A510P/CA510P/A500/A510/CA510)

- (5) Raise the drum assembly just above and remove the harness from the harness holder at the bottom.

Caution

Be careful not to raise the drum assembly by holding the brush/slip ring assembly.

- (6) Disconnect three connectors CN602, CN610, and CN612 in the state of step (5). The drum assembly can then be removed.

Caution

Be careful not to touch the audio/TC head and peripheral tape guides when removing the drum assembly.

- (7) Loosen the hexagonal screw, then remove the demagnetization head assembly from the drum assembly.

Caution

Only the unit applied to the following serial number:

- DVW-A500P (EK): S/N 12036 and higher
- DVW-A510P (EK): S/N 10721 and higher
- DVW-CA510P (EK): S/N 10051 and higher
- DVW-A500 (UC): S/N 11288 and higher
- DVW-A510 (UC): S/N 10257 and higher
- DVW-CA510 (UC): S/N 10010 and higher

• Disconnect the Connectors

• When removing the demagnetization head assembly (Only DVW-A500P/A510P/CA510P/A500/A510/CA510)

Remove the Drum Assembly

Installation

5. Cleaning

Clean the new drum assembly mounting surfaces and chassis mounting surfaces with a cleaning cloth moistened with cleaning fluid.

Caution

After cleaning, wipe with a dry cleaning cloth.

6. Install the Drum Assembly

- (1) Confirm that there is no clearance between the spacer and the washer. (If clearance exists, tighten the hexagonal screw and the spacer.)
Then insert the demagnetization head into the hole of the drum support, and tighten the hexagonal screw.

Tightening torque: $39.2 \times 10 \text{ N}\cdot\text{m}$
(4 kgf·cm)

Caution

Only the unit applied to the following serial number:

- DVW-A500P (EK): S/N 12036 and higher
- DVW-A510P (EK): S/N 10721 and higher
- DVW-CA510P (EK): S/N 10051 and higher
- DVW-A500 (UC): S/N 11288 and higher
- DVW-A510 (UC): S/N 10257 and higher
- DVW-CA510 (UC): S/N 10010 and higher

- (2) Hold the drum assembly as shown in the figure and connect the three connectors disconnected in (6) of step 4.

Caution

1. Hold the height determining plate and the drum support at that time. Be careful not to hold the upper drum and the brush/slip ring assembly.
 2. Pay attention to the direction of the connectors.
- (3) Fix the harness by a harness holder as shown in the figure.

• When installing the demagnetization head assembly (Only DVW-A500P/A510P/CA510P/A500/A510/CA510)

• When connecting the Connectors

• How to fix the Harness

• How to hold the Drum Assembly

- (4) Align the two positioning holes of the drum assembly with the two positioning pin of the chassis while passing the harness under the chassis.

Caution

1. Be careful not to touch the audio/TC head and tape guide at that time.
 2. Be careful not to put the harness between the lower drum and the chassis.
- (5) Confirm that the drum assembly is firmly inserted into the positioning pins.
- (6) Rotate the inner drum assembly manually counterclockwise and align the upper drum assembly holes with the fixing screw positions.
- (7) Tighten the screw tentatively.
- (8) Tighten other two screws tentatively in the same way as in steps (6) and (7).
- (9) Tighten the three screws each by two or three turns in the order of counterclockwise.

Tightening torque: $78.4 \times 10^{-2} \text{ N}\cdot\text{m}$
(8 kgf·cm)

- (10) Connect the connector of the demagnetization head assembly into the connector on the harness rail.

Caution

Only the unit applied to the following serial number:

- DVW-A500P (EK): S/N 12036 and higher
- DVW-A510P (EK): S/N 10721 and higher
- DVW-CA510P (EK): S/N 10051 and higher
- DVW-A500 (UC): S/N 11288 and higher
- DVW-A510 (UC): S/N 10257 and higher
- DVW-CA510 (UC): S/N 10010 and higher

7. Connect the Flexible Board

Connect the flexible board into connector CN241 on the HN-185 board, then lock.

8. Cleaning

Clean the portion below.

- (1) Rotary heads (Refer to Section 7-1-2.)
- (2) Upper drum's tape running surface (Refer to Section 7-1-3.)
- (3) Lower drum's tape running surface (Refer to Section 7-1-4.)

Caution

After cleaning, wipe with a dry cleaning cloth.

• When installing the Drum Assembly on the Chassis

• When installing the connector of the demagnetization head assembly (Only DVW-A500P/A510P/CA510P/A500/A510/CA510)

Install the Drum Assembly

9. Install the Upper Drum Cover

- (1) Tighten the two screws while pushing the upper drum cover in the direction of the drum support.

Tightening torque: $14.7 \times 10^{-2} \text{ N}\cdot\text{m}$
(1.5 kgf·cm)

- (2) Confirm that the rubber of the upper drum cover does not turn over.
- (3) Confirm that there is no clearance between the upper drum cover and the upper drum.

Install the Upper Drum Cover

10. Install the Rotary Head Cleaner Assembly

- (1) Insert the cleaning roller from the clearance between the drum support and full erase head as shown in the figure.
- (2) Align the two pins of the rotary head cleaner assembly with the two holes of the drum support.
- (3) Tighten the screw while moving the rotary head cleaner assembly in the direction indicated by the arrow A.
- (4) Fix the harness to the sensor holder position shown in the figure.
- (5) Connect the connector into connector CN232 on the HN-184 board.
- (6) Bind the full erase head harness and the rotary head cleaner harness with the harness clumper (or the equivalent).

Install the Rotary Head Cleaner Assembly

Adjustment after Replacement**11. Confirm the Drum Motor Operation**

Refer to Section 5-2. (C015 : DRUM MOTOR)

12. Adjust the Tape Running

Refer to Section 8-4-2.

13. Adjust the Video Tracking

Refer to Section 8-4-3.

14. Adjust the CTL Head Height

Refer to Section 8-4-4.

15. Adjust the CTL Head Position

Refer to Section 8-4-5.

16. Adjust the Audio/TC Head Height

Refer to Section 8-4-6.

17. Adjust the Audio/TC Head Azimuth

Refer to Section 8-4-7.

18. Confirm the Audio/TC Head Head-to-Tape Contact

Refer to Section 8-4-8.

19. Adjust the Audio/TC Head Position

Refer to Section 8-4-9.

20. Confirm the Audio Level in REV Mode

Refer to Section 8-4-10.

21. Confirm the Tape Running

Refer to Section 8-4-2.

22. Perform the Servo/DT and RF Adjustment

Refer to Section 8-5.

23. Perform the Adjustment after Drum Replacement

Refer to Section 8-6.

8-2-4. Cleaning Roller and Rotary Head Cleaner Assembly Replacement

Outline

Replacement
1. Remove the Harness (CN232/HN-184 Board)
2. Remove the Rotary Head Cleaner Assembly
3. Replace the Cleaning Roller
4. Install the Rotary Head Cleaner Assembly
5. Adjust the Cleaning Roller Position
6. Install the Harness (CN232/HN-184 Board)
Adjustment after Replacement
7. Confirm the Cleaning Solenoid Operation (Refer to Section 5-2.) (C023: CLEANING ROLLER)

Note

When the cleaning roller is replaced, it is recommended to replace the CR spacer at the same time.

- CR spacer : 3-182-765-02

Removal

- 1. Remove the Harness**
 - (1) Disconnect the connector from connector CN232 on the HN-184 board.
 - (2) Cut the harness clamber.
 - (3) Remove the harness from the sensor holder.
- 2. Remove the Rotary Head Cleaner Assembly**

Remove the screw, shift the rotary head cleaner assembly in the direction indicated by the arrow A, and remove it from the drum support.

Remove/Install the Rotary Head Cleaner Assembly

- 3. Replace the Cleaning Roller**
 - (1) Remove the CR spacer, and remove the cleaning roller.
 - (2) Pass a new cleaning roller through the shaft as shown in the figure. Then fix the cleaning roller by the CR spacer.
 - (3) Move the cleaning roller in the vertical direction.
At this time, confirm that there is no vertical play.

Installation

- 4. Install the Rotary Head Cleaner Assembly**
 - (1) Insert the cleaning roller from the clearance between the drum support and full erase head.
 - (2) Align the two pins of the rotary head cleaner assembly with the two holes of the drum support.
 - (3) Tighten the screw while moving the rotary head cleaner assembly in the direction indicated by the arrow B.
 - (4) Write the time of replacement of the cleaning roller on the hours label pasted on the rotating head cleaner assembly.

Replace the Cleaning Roller

5. Adjust the Cleaning Roller Position

- (1) Check that the cleaning roller does not come in contact with the inner drum as visual. (Spec.1)

If the cleaning roller comes in contact with the inner drum, bend the portion B of the video head cleaner sub assembly in the direction of the arrow C.

- (2) Check that the cleaning roller does not come in contact with the terminal of the full erase head as visual. (Spec.2)

If the cleaning roller comes in contact with the terminal of the full erase head, bend the portion B of the video head cleaner sub assembly in the direction of the arrow D.

- (3) Press the iron core in the direction of the arrow. At that time, check that clearance exists between the cleaner lever and the video head cleaner sub assembly. (Spec.3)

If clearance does not exist, bend the portion B of the video head cleaner sub assembly in the direction of the arrow D.

- (4) Repeat steps (1) through (3) above until the specifications 1 through 3 are satisfied.

6. Install the harness

- (1) Fix the harness to the sensor holder position shown in the figure.
- (2) Connect a connector into connector CN232 on the HN-184 board.
- (3) Bind the full erase head harness and the rotary head cleaner harness with the harness clumper (or the equivalent).

Adjustment after Replacement

7. Confirm the Cleaning Solenoid Operation

Refer to Section 5-2.
(C023: CLEANING ROLLER)

8-2-5. AT Head Cleaner Replacement

Outline

Replacement
1. Remove the CL Arm Assembly
2. Install the CL Arm Assembly
3. Confirm the CL Arm Assembly Operation

Note

- When the cleaning roller becomes dirty or was damaged, replace the CL arm assembly.
- Do not use the stop washer fixing the CL arm assembly again after it was removed once.
- Adjustment after the CL arm assembly replacement is not required. However, confirm the CL arm assembly operation.

Removal

1. Remove the CL Arm Assembly
- (1) Turn the M gear of the gear box assembly manually and move the CL arm assembly to the position shown in the figure.
- Note: Move the CL arm assembly to the front of the HN-185 board. If not, the CL arm assembly cannot be removed because the stop washer is hidden by other parts.
- (2) Remove the stop washer at the top of the CL arm.
- (3) Remove the CL arm assembly from the threading ring.

Caution

Do not remove the spring at the bottom of the CL arm from the shaft.

Installation

2. Install the CL Arm Assembly
- (1) Pass a new CL arm assembly through the shaft while hooking the spring as shown in the figure.
- Caution
- Insert the short-end spring into the groove of the threading ring and the long-end spring into the hole of the CL arm assembly.
- (2) Fix the CL arm assembly by the stop washer.

Remove/Install the CL Arm Assembly

3. Confirm the CL Arm Assembly Operation

- (1) Turn the M gear of the gear box assembly manually and confirm the items below while repeating the threading and unthreading.
 - The CL arm assembly moves along the CL guide rail.
 - The cleaning roller cleans the audio/TC head.
 - A clearance exists between the CL arm assembly and AT shield case while the audio/TC head is cleaned.
- (2) Turn the power on and confirm that the CL arm assembly smoothly operates while repeating the threading and unthreading.

**Confirm the CL Arm Assembly Operation**

8-2-7. Pinch Roller Replacement

Outline

Replacement
1. Remove the Pinch Arm Assembly
2. Install the Pinch Arm Assembly
3. Adjust the Pinch Arm Assembly Vertical Play
4. Cleaning (Pinch Roller Surface)
Adjustment after Replacement
5. Confirm the Tape Running (Refer to Section 8-4-2.)
6. Confirm the Audio/TC Head Height (Refer to Section 8-4-6.)
7. Confirm the Audio/TC Head Azimuth (Refer to Section 8-4-7.)

Note

- When the pinch roller was damaged or worn, replace the pinch roller assembly.
- Do not use the stop washer fixing the pinch arm assembly again after it was removed once.

Tools

- Thickness gauge: 9-911-053-00
- Cleaning cloth: 3-184-527-01
- Cleaning fluid: 9-919-573-01

Removal

1. Remove the Pinch Arm Assembly
- (1) Remove the stop washer at the top of the pinch arm.

Caution

If a poly-slider washer is inserted between the pinch arm assembly and the stop washer, remove it. This poly-slider washer is used for vertical play adjustment.

- (2) Remove the pinch arm assembly from the threading ring.

Caution

Do not remove the poly-slider washer and spring at the bottom of the pinch arm assembly from the shaft.

Installation

2. Install the Pinch Arm Assembly
- (1) Pass a new pinch arm assembly through the shaft while hooking the spring as shown in the figure.

Caution

Insert the short-end spring into the groove of the threading ring and hook the long-end spring to the pin of the pinch arm assembly.

- (2) Fix the pinch arm assembly by the stop washer.
- (3) Push the pinch arm assembly manually in the direction of the drum, then release. At that time, confirm that the pinch arm assembly smoothly returns to the former position.

Remove/Install the Pinch Arm Assembly

3. **Adjust the Pinch Arm Assembly Vertical Play**

Move the Pinch Arm Assembly in the vertical direction.
At this time, confirm that the vertical play satisfies the specification.

If the specification is not satisfied, perform the adjustment below.

- ① Remove the stop washer.
- ② Install or remove the poly-slider washer at the upper of the Pinch Arm.
- ③ Fix the pinch arm assembly by the stop washer, confirm again that the specification is met.

4. **Cleaning**

Clean the pinch roller surface with a cleaning cloth moistened with cleaning fluid.

Adjust the Pinch Arm Assembly Vertical Play

Adjustment after Replacement

5. **Confirm the Tape Running**

Refer to Section 8-4-2.

6. **Confirm the Audio/TC Head Height**

Refer to Section 8-4-6.

7. **Confirm the Audio/TC Head Azimuth**

Refer to Section 8-4-7.

8-2-8. Audio/TC Head Replacement

Outline

Replacement
1. Remove the CL Guide Rail
2. Disconnect the Connector
3. Remove the Audio/TC Head Assembly
4. Remove the Audio/TC Head
5. Install the Audio/TC Head
6. Install the Audio/TC Head Assembly
7. Connect the Connector
8. Install the CL Guide Rail
9. Cleaning (Audio/TC Head Surface)
Adjustment after Replacement
10. Adjust the Audio/TC Head Zenith (Refer to Section 8-4-1.)
11. Adjust the Tape Running (Refer to Section 8-4-2.)
12. Adjust the Audio/TC Head Height (Refer to Section 8-4-6.)
13. Adjust the Audio/TC Head Azimuth (Refer to Section 8-4-7.)
14. Adjust the Audio/TC Head Head-to-Tape Contact (Refer to Section 8-4-8.)
15. Adjust the Audio/TC Head Position (Refer to Section 8-4-9.)
16. Confirm the Audio Level in REV Mode (Refer to Section 8-4-10.)
17. Confirm the Video Tracking (Refer to Section 8-4-3.)
18. Confirm the Tape Running (Refer to Section 8-4-2.)
19. Perform the Servo/DT Check (Refer to Section 5-2.) (C04: SAT CHECK)
20. Perform the Adjustment after Audio/TC Head Replacement (Refer to Section 8-7.)

Tools

- Cleaning cloth: 3-184-527-01
- Cleaning fluid: 9-919-573-01
- Torque screwdriver (6 kg•cm) (JB-5251): J-6252-510-A
- Torque screwdriver's bit (+2 mm, l=75 mm): J-6323-420-A

Removal

1. **Remove the CL Guide Rail**
Remove the two screws, then remove the CL guide rail.

Remove the CL Guide Rail

2. **Disconnect the Connector**
Disconnect a connector on the audio/TC head board.
3. **Remove the Audio/TC Head Assembly**
Remove the two screws, then remove the audio/TC head assembly from the unit.

Caution

Be careful not to touch the drum (especially rotary heads). Also, take care not to damage the peripheral tape guides.

Remove the Audio/TC Head Assembly

4. Remove the Audio/TC Head

- (1) Remove the two screws, then remove the audio/TC head and adjustment plate from the AT bracket.
- (2) Remove the AT shield case.
- (3) Remove the AT shield plate.

Installation**5. Install the Audio/TC Head**

- (1) Put a new head into the AT shield case and align the hole position.
- (2) Align the hole position with the adjustment plate put between the audio/TC head and AT bracket, then tighten the two screws tentatively.
- (3) Tighten the screws after confirming that the specification is satisfied.

Tightening torque: $19.6 \times 10^{-2} \text{ N}\cdot\text{m}$
(2 kg \cdot cm)

- (4) Hook the claw of the AT shield plate on the audio/TC head board.

**Remove/install the Audio/TC Head**

6. Install the Audio/TC Head Assembly

- (1) Align the two longitudinal holes of the Audio/TC head assembly with the two bosses of the chassis.

Caution

1. Be careful not to touch the drum (especially rotary heads). Also, take care not to damage the peripheral tape guides.
2. Be careful not to damage the audio/TC head surface.

- (2) Align the bosses of the chassis with center of the longitudinal holes and tighten the two screws.

7. Connect the Connector

Connect a connector into the audio/TC head board.

Install the Audio/TC Head Assembly

8. Install the CL Guide Rail

Install the CL guide rail with two screws.

9. Cleaning

Clean the audio/TC head surface with a cleaning cloth moistened with cleaning fluid.

Caution

After cleaning, wipe with a dry cleaning cloth.

Install the CL Guide Rail

Adjustment after Replacement

- 10. Adjust the Audio/TC Head Zenith**
Refer to Section 8-4-1.
- 11. Adjust the Tape Running**
Refer to Section 8-4-2.
- 12. Adjust the Audio/TC Head Height**
Refer to Section 8-4-6.
- 13. Adjust the Audio/TC Head Azimuth**
Refer to Section 8-4-7.
- 14. Adjust the Audio/TC Head Head-to-Tape Contact**
Refer to Section 8-4-8.
- 15. Adjust the Audio/TC Head Position**
Refer to Section 8-4-9.
- 16. Confirm the Audio Level in REV Mode**
Refer to Section 8-4-10.
- 17. Confirm the Video Tracking**
Refer to Section 8-4-3.
- 18. Confirm the Tape Running**
Refer to Section 8-4-2.
- 19. Perform the Servo/DT Check**
Refer to Section 5-2. (C04: SAT CHECK)
- 20. Perform the Adjustment after Audio/TC Head Replacement**
Refer to Section 8-7.

8-2-9. CTL Head Replacement

Outline

Replacement
1. Disconnect the Connector
2. Remove the CTL/FE Head Assembly
3. Remove the CTL Head
4. Install the CTL Head
5. Install the CTL/FE Head Assembly
6. Connect the Connector
7. Cleaning (CTL Head Surface)
Adjustment after Replacement
8. Adjust the Tape Running (Refer to Section 8-4-2.)
9. Adjust the CTL Head Height (Refer to Section 8-4-4.)
10. Adjust the CTL Head Position (Refer to Section 8-4-5.)
11. Confirm the Tape Running (Refer to Section 8-4-2.)
12. Confirm the Audio/TC Position (Refer to Section 8-4-9.)
13. Adjust Drum Phase (Refer to Section 8-5-1.)

Tools

- Cleaning cloth: 3-184-527-01
- Cleaning fluid: 9-919-573-01
- Torque screwdriver (6 kg•cm) (JB-5251): J-6252-510-A
- Torque screwdriver's bit (+2 mm, l=75 mm): J-6323-420-A

Note

The replacement procedures for the CTL head depend on the serial number of the unit.

- ① If the unit applies to the following serial number, replace the CTL head referring to "For the New Component" (page 8-44 to 8-45).
- DVW-A500P (EK): S/N 12036 and higher
 - DVW-500P (EK): S/N 11046 and higher
 - DVW-A500 (UC): S/N 11288 and higher
 - DVW-500 (UC): S/N 11667 and higher
- ② If the unit applies to the following serial number, replace the CTL head referring to "For the Old Component" (page 8-46 to 8-48).
- DVW-A500P (EK): S/N 10001 thru. 12035
 - DVW-500P (EK): S/N 10001 thru. 11045
 - DVW-A500 (UC): S/N 10001 thru. 11287
 - DVW-500 (UC): S/N 10001 thru. 11666

For the New Component

Removal

1. **Disconnect the Connector**
Disconnect the connectors on the CTL head board and full erase head board.
2. **Remove the CTL/FE Head Assembly**
Remove the screw, then remove the CTL/FE head assembly.

Caution

Be careful not to touch the drum (especially rotary heads). Also, take care not to damage the peripheral tape guides.

Remove the CTL/FE Head Assembly

3. **Remove the CTL Head**
(1) Remove the two CTL head fixing screws, then remove the CTL head.

Caution

1. Be careful not to damage the full erase head when removing the CTL head.
2. Never loosen or remove the screws except for the CTL head fixing screws. If these screws are loosened or removed, the zenith of the CTL head and full erase head will be out of specification.

- (2) Unsolder the connector pin.

Remove the CTL Head

Installation

4. Install the CTL Head

- (1) Solder the connector pin to the CTL head board.
- (2) Tighten the two screws while moving the CTL head in the direction indicated by arrows A and B.

Tightening torque: $19.6 \times 10^{-2} \text{ N}\cdot\text{m}$
(2kg \cdot cm)

Caution

Be careful not to damage the full erase head and CTL head.

Install the CTL Head

5. Install the CTL/FE Head Assembly

- (1) Confirm that the threading ring is in the unthreading end state.
- (2) Align longitudinal holes A and B of the CTL/FE head assembly with the bosses of the chassis.

Caution

Be careful not to touch the drum (especially rotary heads). Also, take care not to damage the peripheral tape guides.

- (3) Align the boss of the chassis with center of the longitudinal hole A and tighten the screw.

6. Connect the Connector

Connect the connectors into the CTL head board and full erase head board.

7. Cleaning

Clean the CTL head and full erase head surfaces with a cleaning cloth moistened with cleaning fluid.

Install the CTL/FE Head Assembly

Adjustment after Replacement

8. **Adjust the Tape Running**
Refer to Section 8-4-2.

9. **Adjust the CTL Head Height**
Refer to Section 8-4-4.

10. **Adjust the CTL Head Position**
Refer to Section 8-4-5.

11. **Confirm the Tape Running**
Refer to Section 8-4-2.

12. **Confirm the Audio/TC Head Position**
Refer to Section 8-4-9.

13. **Adjust the Drum Phase**
Refer to Section 8-5-1.

For the Old Component

Removal

- 1. **Disconnect the Connector**
Disconnect the connectors on the CTL head board and full erase head board.
- 2. **Remove the CTL/FE Head Assembly**
Remove the screw, then remove the CTL/FE head assembly.

Caution

Be careful not to touch the drum (especially rotary heads). Also, take care not to damage the peripheral tape guides.

Remove the CTL/FE Head Assembly

- 3. **Remove the CTL Head**
(1) Remove the two screws, then remove the CTL head.

Caution

- 1. Be careful not to damage the full erase head when removing the CTL head.
- 2. Never loosen or remove the two screws fixing the CTL/FE bracket. If these screws are loosened or removed, the zenith of the CTL head and full erase head will be out of specification.

- (2) Unsolder the connector pin.

Remove the CTL Head

Installation

- 4. **Install the CTL Head**
(1) Solder the connector pin to the CTL head board.
(2) Tighten the two screws tentatively while moving the CTL head in the direction indicated by arrows A and B.

Caution

Be careful not to damage the full erase head and CTL head.

- (3) Tighten the screws after confirming that the specification is satisfied.

Tightening torque: $19.6 \times 10^{-2} \text{ N}\cdot\text{m}$
(2kg \cdot cm)

Install the CTL Head

5. Install the CTL/FE Head Assembly

- (1) Confirm that the threading ring is in the unthreading end state.
- (2) Align longitudinal holes A and B of the CTL/FE head assembly with the bosses of the chassis.

Caution

Be careful not to touch the drum (especially rotary heads). Also, take care not to damage the peripheral tape guides.

- (3) Align the boss of the chassis with center of the longitudinal hole A and tighten the screw.

6. Connect the Connector

Connect the connectors into the CTL head board and full erase head board.

7. Cleaning

Clean the CTL head and full erase head surfaces with a cleaning cloth moistened with cleaning fluid.

Caution

After cleaning, wipe with a dry cleaning cloth.

Install the CTL/FE Head Assembly

Adjustment after Replacement

8. Adjust the Tape Running

Refer to Section 8-4-2.

9. Adjust the CTL Head Height

Refer to Section 8-4-4.

10. Adjust the CTL Head Position

Refer to Section 8-4-5.

11. Confirm the Tape Running

Refer to Section 8-4-2.

12. Confirm the Audio/TC Head Position

Refer to Section 8-4-9.

13. Adjust the Drum Phase

Refer to Section 8-5-1.

8-2-10. Capstan Motor Replacement

Outline

Replacement
1. Remove the Rotary Head Cleaner Assembly
2. Open the DR-307/200 Board
3. Remove the Capstan Motor
4. Install the Capstan Motor
5. Close the DR-307/200 Board
6. Install the Rotary Head Cleaner Assembly
7. Cleaning (Capstan Motor Shaft)
Adjustment after Replacement
8. Confirm the Pinch Press Clearance (Refer to Section 8-3-1.)
9. Confirm the Tape Running (Refer to Section 8-4-2.)
10. Confirm the Capstan Motor Operation (Refer to Section 5-2.) (C014 : CAPSTAN MOTOR)
11. Adjust the Capstan FG Duty (Refer to Section 5-7.) (A003 : CAPSTAN FG DUTY)
12. Adjust the Capstan Free Speed (Refer to Section 5-7.) (A010 : CAPSTAN FREE SPEED)
13. Store the Adjustment Data (Refer to Section 5-7.) (A012 : NV-RAM CONTROL)
14. Adjust the Capstan FG Level (Refer to Section 5-7.) (A020 : CAPSTAN FG LEVEL)
15. Store the Adjustment Data (Refer to Section 5-7.) (A023 : NV-RAM CONTROL)

Note

Replace the capstan motor with the left side panel of the unit down.

Tools

- Cleaning cloth: 3-184-527-01
- Cleaning fluid: 9-919-573-01

Removal

1. Remove the Rotary Head Cleaner Assembly
- (1) Disconnect a connector from connector CN232 on the HN-184 board.
 - (2) Cut the harness clumper.
 - (3) Remove the harness from the sensor holder.
 - (4) Remove the screw, shift the rotary head cleaner assembly in the direction indicated by the arrow A, and remove it from the drum support.

Note: To remove the fixing screws of the capstan motor, remove the rotary head cleaner assembly.

Remove the Rotary Head Cleaner Assembly

2. Open the DR-307/200 Board
- Open the DR-307/200 board with the left side panel of the unit down.

Open the DR-307/200 Board

3. Remove the Capstan Motor

- (1) Disconnect the connector on the capstan motor board.
- (2) Remove the two screws while holding the capstan motor by hand.

Caution

Be careful not to drop the capstan motor.

Installation**4. Install the Capstan Motor**

- (1) Pass a new capstan motor through the hole of the chassis in the direction shown in the figure and tighten the two screws.

Caution

Be careful not to damage the capstan motor shaft when passing the capstan motor through the hole of the chassis.

- (2) Connect the connector disconnected in (1) of step 3 to the capstan motor board.

• Upper Side**• Back Side****Remove/Install the Capstan Motor**

5. Close the DR-307/200 Board

Put the two holes on the DR-307/200 board into the two portions A of the PCB holder shown in the figure.

Close the DR-307/200 Board

6. Install the Rotary Head Cleaner Assembly

- (1) Insert the cleaning roller from the clearance between the drum support and full erase head as shown in the figure.
- (2) Align the two pins of the rotary head cleaner assembly with the two holes of the drum support.
- (3) Tighten the screw while moving the rotary head cleaner assembly in the direction indicated by the arrow A.
- (4) Fix the harness to the sensor holder position shown in the figure.
- (5) Connect a connector into connector CN232 on the HN-184 board.
- (6) Bind the full erase head harness and the rotary head cleaner harness with the harness clumper (or the equivalent).

7. Cleaning

Clean the capstan motor shaft with a cleaning cloth moistened with cleaning fluid.

Caution

After cleaning, wipe with a dry cleaning cloth.

Install the Rotary Head Cleaner Assembly

Adjustment after Replacement

- 8. Confirm the Pinch Press Clearance**
Refer to Section 8-3-1.
- 9. Confirm the Tape Running**
Refer to Section 8-4-2.
- 10. Confirm the Capstan Motor Operation**
Refer to Section 5-2.
(C014 : CAPSTAN MOTOR)
- 11. Adjust the Capstan FG Duty**
Refer to Section 5-7.
(A003 : CAPSTAN FG DUTY)
- 12. Adjust the Capstan Free Speed**
Refer to Section 5-7.
(A010 : CAPSTAN FREE SPEED)
- 13. Store the Adjustment Data**
Refer to Section 5-7.
(A012 : NV-RAM CONTROL)
- 14. Adjust the Capstan FG Level**
Refer to Section 5-7.
(A020 : CAPSTAN FG LEVEL)
- 15. Store the Adjustment Data**
Refer to Section 5-7.
(A023 : NV-RAM CONTROL)

8-2-11. Pinch Solenoid Replacement

Outline

Replacement
1. Disconnect the Connector (CN854/PD-35 Board)
2. Remove the Pinch Press Assembly
3. Remove the PD-35 Board
4. Remove the P Stopper
5. Remove the Pinch Solenoid
6. Install the Pinch Solenoid
7. Install the P Stopper
8. Install the PD-35 Board
9. Install the Pinch Press Assembly
10. Connect the Connector (CN854/PD-35 Board)
Adjustment after Replacement
11. Confirm the Pinch Solenoid Operation (Refer to Section 5-2.) (C020 : PINCH ROLLER)
12. Adjust the Pinch Press Clearance (Refer to Section 8-3-1.)

Removal

1. **Disconnect the Connector**
Disconnect connector CN854 on the PD-35 board.
2. **Remove the Pinch Press Assembly**
Remove the two screws, then remove the pinch press assembly from the unit.

Remove the Pinch Press Assembly

3. Remove the PD-35 Board

- (1) Remove the screw, then remove the PD-35 board from the pinch press assembly.
- (2) Unsolder the three harnesses wired on the PD-35 board.

**Remove the PD-35 Board****4. Remove the P Stopper**

Remove the two screws and washers, then remove the P stopper.

**Remove the P Stopper**

5. Remove the Pinch Solenoid

- (1) Extract the P joint shaft.
- (2) Remove the two screws and washers, then remove the pinch solenoid.

Remove the Pinch Solenoid

Installation

6. Install the Pinch Solenoid

- (1) Install a new solenoid to the P base in the direction shown in the figure.
- (2) Bend the spring in the direction indicated by the arrow and bring it into contact with surface A of the solenoid shown in the figure.
- (3) Put the P limiter into the notch of the solenoid's iron core and pass the P joint shaft through the hole of the iron core in the direction shown in the figure.
- (4) Confirm that the other end of the spring is put on the notch of the P press lever.

Install the Pinch Solenoid

7. Install the P Stopper

- (1) Pass the longitudinal hole of the P stopper through the P joint shaft, then pass the round hole through the shaft of the P press lever.
- (2) Put the washers and tighten the screws.

Install the P Stopper

8. Install the PD-35 Board

- (1) Wire the harnesses to the PD-35 board as shown in the figure, then solder.
- (2) Insert the PD-35 board into the P stopper and tighten the screw.

Install the PD-35 Board

9. Install the Pinch Press Assembly

Align the notch of the pinch press assembly with the center of the pin and tighten the two screws.

10. Connect the Connector

Connect the connector into connector CN854 on the PD-35 board.

Install the Pinch Press Assembly

Adjustment after Replacement

11. Confirm the Pinch Solenoid Operation

Refer to Section 5-2.
(C020 : PINCH ROLLER)

12. Adjust the Pinch Press Clearance

Refer to Section 8-3-1.

8-2-12. Brake Lining Replacement

Outline

Replacement
1. Remove the Reel Table Assembly
2. Remove the Brake Assembly
3. Remove the Brake Lining
4. Install the Brake Lining
5. Install the Brake Assembly
6. Install the Reel Table Assembly
Adjustment after Replacement
7. Confirm the Reel Table Height (Refer to Section 8-3-4.)
8. Confirm the Reel Brake Clearance (Refer to Section 8-3-5.)
9. Confirm the Reel Brake Release Amount (Refer to Section 8-3-6.)

Note

How to replace the brake lining assembly is the same on the supply and take-up sides.

Tools

- L-shaped wrench (1.5 mm): 7-700-736-05
- Cleaning cloth: 3-184-527-01
- Cleaning fluid: 9-919-573-01

Removal

1. Remove the Reel Table Assembly
- (1) Align one of the two notches at the bottom of the reel table assembly with the groove position of the reel shift plate assembly.
 - (2) Insert the L-shaped wrench into the notch at the bottom of the reel table assembly along the groove of the reel shift plate.
 - (3) Loosen the screw.
 - (4) Align another notch at the bottom of the reel table assembly with the groove position of the reel shift plate assembly.
 - (5) Loosen the screw in the same way as in step (2).
 - (6) Remove the reel table assembly.

Caution

When the reel table assembly is removed, a poly-slider washer may adhere to it. In this case, remove the poly-slider washer from the reel table assembly and return it to the reel motor shaft position. This poly-slider washer is used for reel table height adjustment.

Remove the Reel Table Assembly

2. Remove the Brake Assembly

- (1) Unhook the spring put on the reel shift plate assembly.
- (2) Remove the E ring, then remove the brake assembly.

3. Remove the Brake Lining

- Unhook the spring put on the brake arm block, then remove the brake lining.

Installation**4. Install the Brake Lining**

- (1) Combine a new brake lining with the brake arm block as shown in the figure.
- (2) Hook the spring to the brake arm block.

5. Install the Brake Assembly

- (1) Pass the brake assembly through the shaft of the reel shift plate assembly.
- (2) Hook the spring to the reel shift plate assembly.
- (3) Fix the brake assembly by the E ring.

**Remove/Install the Brake Lining****6. Install the Reel Table Assembly**

- (1) Clean the reel table assembly along the circumference.
- (2) Release the reel brake in the direction indicated by the arrow and pass the reel table assembly through the reel motor shaft.

Caution

Tighten the two screws after the reel table height adjustment is completed.

**Install the Reel Table Assembly****Adjustment after Replacement**

7. **Confirm the Reel Table Height**
Refer to Section 8-3-4.
8. **Confirm the Reel Brake Clearance**
Refer to Section 8-3-5.
9. **Confirm the Reel Brake Release Amount**
Refer to Section 8-3-6.

8-2-13. Reel Motor Assembly Replacement

Outline

Replacement
1. Disconnect the Flat Cable (S side: CN321/DR-307, DR-200 Board, T side: CN322/DR-307, DR-200 Board)
2. Remove the Reel Table Assembly
3. Remove the Crank Arm and Slide Shaft Holder
4. Remove the Reel Shift Plate Assembly
5. Disconnect the Flat Cable (S side: CN923/RM Board, T side: CN923/RM Board)
6. Disconnect the Connector (S side: CN926 and 927/RM Board, T side: CN926 and 927/RM Board)
7. Remove the Reel Motor Assembly
8. Cleaning
9. Install the Reel Motor Assembly
10. Connect the Flat Cable (S side: CN923/RM Board, T side: CN923/RM Board)
11. Connect the Connector (S side: CN926 and 927/RM Board, T side: CN926 and 927/RM Board)
12. Install the Slide Shaft
13. Install the Reel Shift Plate Assembly
14. Smear Grease to the Slide Shaft
15. Install the Crank Arm
Adjustment after Replacement
16. Confirm the Reel Motor Shaft Slantness (Refer to Section 8-3-2.)
17. Install the Reel Table Assembly
18. Confirm the Cassette Pillar Height (Refer to Section 8-3-3.)
19. Confirm the Reel Table Height (Refer to Section 8-3-4.)
20. Connect the Flat Cable (S side: CN321/DR-307, DR-200 Board, T side: CN322/DR-307, DR-200 Board)
21. Confirm the Reel Brake Clearance (Refer to Section 8-3-5.)
22. Confirm the Reel Brake Release Amount (Refer to Section 8-3-6.)
23. Confirm the Reel Motor Operation (Refer to Section 5-2.) (C010 : S REEL MOTOR/ C011 : T REEL MOTOR)
24. Adjust the Reel FG Duty (Refer to Section 5-7.) (A001 : S REEL FG DUTY / A002 : T REEL FG DUTY)
25. Adjust the Reel Offset/Friction (Refer to Section 5-7.) (A004 : S REEL OFFSET/FRIC / A005: T REEL OFFSET/FRIC)
26. Adjust the Reel Torque (Refer to Section 5-7.) (A006 : S REEL TORQUE/A007 : T REEL TORQUE)
27. Store the Adjustment Data (Refer to Section 5-7.) (A012 : NV-RAM CONTROL)

Note

The parts consisting reel motor is different between S side and T side. However, how to replace the reel motor assembly is the same for both sides.

Tools

- | | |
|---|--------------|
| • L-shaped wrench (1.5 mm): | 7-700-736-05 |
| • Torque screwdriver (12 kg · cm)(JB-5252): | J-6252-520-A |
| • Torque screwdriver's bit (+ 3 mm, l=90 mm): | J-6323-430-A |
| • Grease (SGL-505): | 7-662-010-04 |
| • Oil: | 7-661-018-18 |
| • Cleaning cloth: | 3-184-527-01 |
| • Cleaning fluid: | 9-919-573-01 |

Removal**1. Disconnect the Flat Cable**

- (1) Place the unit with the left side panel down.
- (2) Disconnect the flat cable connected with DR-307/200 board.
S side: CN321
T side: CN322
- (3) Place the unit to the horizontal position.

**Disconnect the Flat Cable**

2. Remove the Reel Table Assembly

- (1) Align one of the two notches at the bottom of the reel table assembly with the groove of the reel shift plate assembly.
- (2) Insert the L-shaped wrench into the notch of the reel table assembly along the groove of the reel shift plate.
- (3) Loosen the screw.
- (4) Align another notch of the reel table assembly with the groove of the reel shift plate assembly.
- (5) Loosen the screw in the same way as in step (2).
- (6) Remove the reel table assembly.

Caution

When the reel table assembly is removed, a poly-slider washer may adhere to it. In this case, remove that from the reel table assembly and return it to the reel motor shaft position. This poly-slider washer is used for reel table height adjustment.

Remove the Reel Table Assembly

3. Remove the Crank Arm and Slide Shaft Holder

- (1) Place the reel shift plate assembly in the intermediate position of S and L cassette.

Note: The reel shift plate assembly cannot be removed in the S cassette position or T cassette position.

- (2) Remove an E ring and remove the crank arm (B).
- (3) Remove the screw and remove the slide shaft holder.

Remove the Crank Arm and Slide Shaft Holder

4. Remove the Reel Shift Plate Assembly

While pulling out the slide shaft and remove the reel shift plate assembly.

Caution

1. Be careful not to adhere grease smeared the slide shaft to another parts.
2. Be careful not to cause damage to the slide shaft during removal.

Remove the Reel Shift Plate Assembly

5. Disconnect the Flat Cable

Disconnect the flat cable connected with RM board.

6. Disconnect the Connectors

Disconnect the two connectors CN926 and CN927 on the RM board.

Disconnect the Flat Cable and Connectors

7. Remove the Reel Motor Assembly

- (1) Remove the three screws and shield cover, then remove the reel motor assembly.

Caution

1. The shield cover is not required for DVW-500P/510P/500/510.
2. The spacer is inserted between the reel motor and the reel shift plate assembly. Be careful not to lose this spacer since it comes off with the reel motor assembly.

- (2) Remove the poly-slider washer from the reel motor shaft.

Caution

Confirm the quantity of the spacer and be careful not to lose it.

Remove the Reel Motor Assembly

Installation

8. Cleaning

- (1) Clean the reel motor assembly mounting surface and reel shift plate assembly mounting surface with a cleaning cloth moistened with cleaning fluid.
- (2) Clean the shield cover mounting surface with a cleaning cloth moistened with cleaning fluid. (This step is required only DVW-A500P/A510P/A500/A510.)

9. Install the Reel Motor Assembly

- (1) Pass the shield cover through the reel motor shaft and align the pin of the shield cover with the hole of the reel motor. (This step is required only DVW-A500P/A510P/A500/A510.)
- (2) Pass the reel motor assembly through the hole of the reel shift plate as in the direction shown in the figure.
- (3) Tighten the three screws gradually while moving the reel motor assembly in the direction indicated by the arrow A.

Tightening torque: $68.6 \times 10^{-2} \text{ N} \cdot \text{m}$
(7 kgf · cm)

- (4) Pass the poly-slider washer removed in (2) of step 7 through the reel motor shaft.

10. Connect the Flat Cable

- (1) Clean the insertion of the flat cable with a cleaning cloth moistened with cleaning fluid.
- (2) Connect the flat cable disconnected in step 5 into the connector on the RM board, then lock.

Caution

1. Connect the flat cable with its printing surface upside.
2. Be careful not to twist the flat cable when connecting it.

11. Connect the Connector

Connect the two connectors CN926 and CN927 on the RM board.

Install the Reel Motor Assembly

12. Install the Slide Shaft

- (1) Wipe grease from the two holes where the slide shaft to be inserted of the reel shift plate assembly, then clean them.
- (2) Wipe grease from the slide shaft removed in step 4, then clean it.
- (3) Insert the slide shaft to the reel shift plate assembly.

13. Install the Reel Shift Plate Assembly

- (1) Put the slide shaft on the shaft holder while inserting the portion A shown in the figure of the reel shift plate into the slide table.
- (2) Install the slide shaft holder.

Install the Reel Shift Plate Assembly

14. Smear Grease to the Slide Shaft

- (1) Smear grease very lightly to the slide shaft.
- (2) Confirm that the reel shift plate assembly moves smoothly when moving it by hand towards S cassette and L cassette positions.

15. Install the Crank Arm

- (1) Clean the shaft of the crank arm (A), then pour a drop of oil on it.
- (2) Confirm that the reel shift plate assembly is in the intermediate position of S and L cassettes.

Caution

When installing the crank arm, place the reel shift plate assembly in the intermediate position of S and L cassettes for phase adjustment of the gears.

- (3) Install the crank arm (B) to the shaft of the crank arm (A) with an E ring.

Smear Grease and Install the Crank Arm

Adjustment after Replacement

16. Confirm the Reel Motor Shaft Slantness

Refer to Section 8-3-2.

17. Install the Reel Table Assembly

- (1) Clean the circumference of the reel table assembly with a cleaning cloth moistened with cleaning fluid.
- (2) Pass the reel table assembly through the reel motor shaft while moving the reel brake in the direction indicated by the arrow.

Caution

Tighten two fixing screws after the adjustment of reel table height.

18. Confirm the Cassette Pillar Height

Refer to Section 8-3-3.

19. Confirm the Reel Table Height

Refer to Section 8-3-4.

20. Connect the Flat Cable

- (1) Place the unit with the left side panel down.
- (2) Connect the flat cable into the connector on the DR-307/200 board.
S side: CN321
T side: CN322
- (3) Place the unit to the horizontal position.

Install the Reel Table Assembly

Connect the Flat Cable

21. Confirm the Reel Brake Clearance

Refer to Section 8-3-5.

22. Confirm the Reel Brake Release Amount

Refer to Section 8-3-6.

23. Confirm the Reel Motor Operation

Refer to Section 5-2. (C010 : S REEL MOTOR/ C011 : T REEL MOTOR)

24. Adjust the Reel FG Duty

Refer to Section 5-7. (A001 : S REEL FG DUTY / A002 : T REEL FG DUTY)

25. Adjust the Reel Offset/Friction

Refer to Section 5-7. (A004 : S REEL OFFSET/FRIC / A005: T REEL OFFSET/FRIC)

26. Adjust the Reel Torque

Refer to Section 5-7. (A006 : S REEL TORQUE/A007 : T REEL TORQUE)

27. Store the Adjustment Data

Refer to Section 5-7. (A012 : NV-RAM CONTROL)

8-2-14. Fan Motor Replacement

Outline

Replacement
1. Disconnect the Connectors (CN150/MB-441 Board, Switching Regulator)
2. Remove the Fan Motor
3. Install the Fan Motor
4. Connect the Connectors (CN150/MB-441 Board, Switching Regulator)

Note

Adjustment after the fan motor replacement is not required.

Removal

- 1. Disconnect the Connectors**
Disconnect the connectors of the switching regulator and connector CN150 on the MB-441 board.
- 2. Remove the Fan Motor**
Remove the screws, then remove the fan motor.

Installation

- 3. Install the Fan Motor**
Install a new fan motor with screws.

Caution

1. Install the fan motor in position send the air out.
2. The fan motors on the switching regulator side and connector panel differ in the type and number of fixing screws.
 - Fan motor on switching regulator side: PSW4x30 (4 pcs)
 - Fan motor on connector panel: BVTT3x30 (2 pcs)
- 4. Connect the Connectors**
Connect the connectors into connector CN150 on the MB-441 board and the switching regulator.

Remove/Install the Fan Motor

8-2-15. Filter Replacement

Outline

Replacement
1. Remove the Cap
2. Replace the Filter
3. Install the Cap

Note

Adjustment after the filter replacement is not required.

Replacement

1. Remove the Cap

Turn the cap counterclockwise and remove it.

2. Replace the Filter

Replace the dirty filter with a new one.

Caution

Be careful not to lose the washer, if it is inserted under the filter.

3. Install the Cap

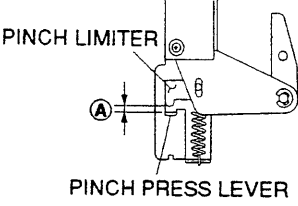

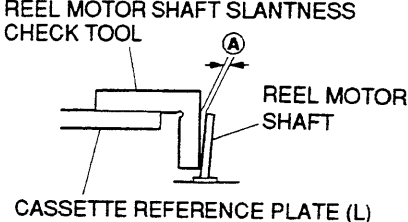

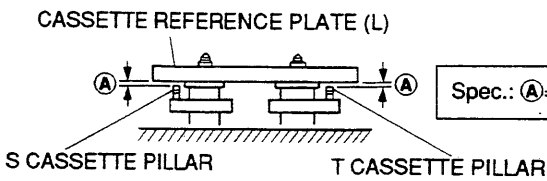

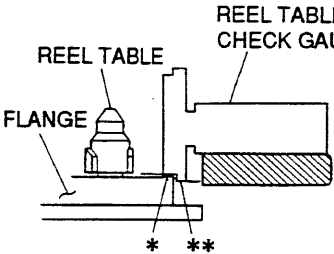

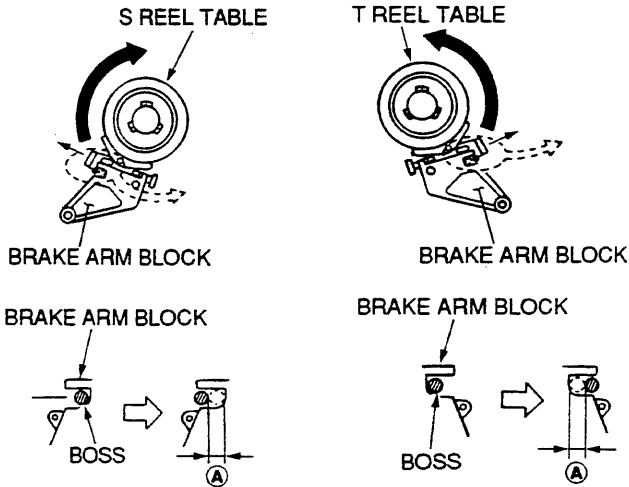

Turn the cap clockwise until it is clicked.

Remove/Install the Filter

8-3. MECHANICAL ADJUSTMENT

Index

Adjustment	Specification	Page
Pinch Press Clearance Adjustment	 <p>Spec.: (A)=0.6 to 0.8 mm</p>	8-73
Reel Motor Shaft Slantness Adjustment	 <p>Spec. 1: (L cassette position) (A) ≤ 0.03 mm</p> <p>Spec. 2: (S cassette position) (A) ≤ 0.1 mm</p>	8-75
Cassette Pillar Height Adjustment	 <p>Spec.: (A)= No clearance</p>	8-77
Reel Table Height Adjustment	 <p>Spec.: The * marked portion of the gauge slide over the flange of the reel table. The ** marked portion of the gauge does not slide over.</p>	8-79
Reel Brake Clearance Check	 <p>Spec.: (A)= Clearance exists.</p>	8-83
Reel Brake Release Amount Adjustment	<p>Spec. 1: The brake lining doesn't touch a reel table while reel table rotating.</p>	8-85

8-3-1. Pinch Press Clearance Adjustment

Note

- Be sure to check the clearance during pinch press when the pinch press assembly is removed.

Tool

- Wire clearance check gauge set: J-6152-450-A

Check

1. Put the Pinch Solenoid into the Energized State

- (1) Turn the M gear of the gear box assembly manually, and put the unit into the threading end mode.
- (2) Press the iron core of the pinch solenoid in the direction of the fully energized state.

2. Check the Pinch Press Clearance

Check that the clearance between the pinch limiter and pinch press lever satisfies the specification.

If the specification is not satisfied, perform steps 3 and later.

Pinch Press Clearance Check

Adjustment

3. Loosen Screws

Loosen the two screws fixing the pinch press assembly by 1/2 to one turn.

4. Adjust the Pinch Press Assembly Position

Put the pinch solenoid into the energized state, then insert the tip of a 3 mm flat-blade screwdriver into the notch of the pinch press assembly and adjust the pinch press assembly position so that the specification is satisfied.

5. Tighten Screws

Tighten the two screws loosened in step 3.

6. Recheck the Pinch Press Clearance

Refer to steps 1 and 2.

Pinch Press Clearance Adjustment

8-3-2. Reel Motor Shaft Slantness Adjustment

Notes

- Be sure to check the slantness of the reel motor shaft when the reel motor assembly is replaced or when the reel shift plate assembly is removed.
- Perform the reel motor shaft slantness adjustment correctly.
If this adjustment is not performed correctly, a reel hub touches the case in a cassette tape, a noise occurs, and the tape does not run correctly. This may damage the tape.

Tools

- Cassette reference plate (L)(MW-088): J-6320-880-A
- Reel motor shaft slantness check tool (MW-087): J-6320-870-A
- Thickness gauge: 9-911-053-00
- Torque screwdriver (12 kg·cm) (JB-5252): J-6252-520-A
- Torque screwdriver's bit (+3 mm, l=50 mm): J-6323-430-A

Check

- 1. Install the Cassette Reference Plate (L)**
Place the cassette reference plate (L) in the direction shown in the figure, then place it on two cassette supports.
- 2. Place the Reel Shift Plate Assembly in the L Cassette Position**
Rotate the drive gear counterclockwise as far as it will go.
- 3. Check the Slantness in the L Cassette Position**
 - (1) Press the check tool against the reel motor shaft from the directions indicated by the arrow.
 - (2) Check that the clearance between the reel motor shaft and tool satisfies specification 1.

If the specification is not satisfied, perform steps 6 through 10.

Reel Motor Shaft Slantness Check (L)

4. Place the Reel Shift Plate Assembly in the S Cassette Position

Rotate the drive gear clockwise as far as it will go.

5. Check the Slantness in the S Cassette Position

- (1) Press the check tool against the reel motor shaft from the directions indicated by the arrow.
- (2) Check that the clearance between the reel motor shaft and tool satisfies specification 2.

If the specification is not satisfied, perform steps 6 and later.

Reel Motor Shaft Slantness Check (S)

Adjustment

6. Loosen Screws

Loosen the three screws fixing the reel motor by one to two turns.

7. Bend Spacer

Bend the adjustment spacer as shown in the figure.

8. Insert Spacer

Insert the adjustment spacer into the square hole on the upper surface of the reel shift plate assembly with tweezers.

9. Tighten Screws

Gradually tighten the three screws loosened in step 6.

Tightening torque: $68.6 \times 10^{-2} \text{ N} \cdot \text{m}$ (7 kgf·cm)

10. Recheck the Reel Motor Shaft Slantness

Refer to steps 2 through 5.

Reel Motor Shaft Slantness Adjustment

8-3-3. Cassette Pillar Height Adjustment (L Cassette)

Note

- Be sure to check the height of the cassette pillars when the reel shift plate assembly is removed.

Tools

- Cassette reference plate (L)(MW-088): J-6320-880-A
- Adjustment mirror (circular): J-6080-029-A
- L-shaped wrench (1.5 mm): 7-700-736-05

Check

1. Install the Cassette Reference Plate (L)

Place the cassette reference plate (L) in the direction shown in the figure, then place it on two cassette supports.

2. Place the Reel Shift Plate Assembly in the Intermediate Position of S and L Cassette

- (1) Rotate the drive gear and place the reel shift plate assembly in the intermediate position of S and L cassettes.

Note: The reel shift plate assembly should be moved to the position where the cassette pillars do not appear from the hole of the reference plate.

- (2) Check that the S and T cassette pillars are positioned under the reference plate.

3. Check the Cassette Pillar Height

Push the three positions (a), (b), and (c) of the cassette reference plate (L) lightly toward the chassis and make sure that the clearance between the shaft cap and cassette reference plate satisfies the specification.

If the specification is not satisfied, perform steps 4 through 6.

DVW-A500 (UC)	: S/N 15993 and Higher
DVW-A500P (CE)	: S/N 17638 and Higher
DVW-500 (UC)	: S/N 12400 and Higher
DVW-500P (CE)	: S/N 14881 and Higher
DVW-A510 (UC)	: S/N 11154 and Higher
DVW-A510P (CE)	: S/N 13276 and Higher
DVW-510 (UC)	: S/N 10638 and Higher
DVW-510P (CE)	: S/N 11065 and Higher

Cassette Pillar Height Check

Adjustment

4. Loosen Fixing Screw

Loosen the fixing screw of the T cassette pillar by one or two turns with L-shaped wrench.

5. Adjust the Cassette Pillar Height

Turn and adjust the shaft cap until the clearance is met the specification, then tighten the fixing screw.

Tightening torque: 0.6 to 0.7 N·m (6 to 7 kgf·cm)

6. Recheck the Cassette Pillar Height

Check that the height of the S and T cassette pillars satisfies the specification.

Caution

Shift the tightening position of the fixing screw when performing readjustment with the specification not satisfied. (Do not tighten the screw in the same position as previous.)

Cassette Pillar Height Adjustment

8-3-3. Cassette Pillar Height Adjustment (S Cassette)

Note

- Be sure to check the height of the cassette pillars when the reel shift plate assembly is removed.

Tools

- Cassette reference plate (L)(MW-088): J-6320-880-A
- Adjustment mirror (circular): J-6080-029-A
- L-shaped wrench (1.5 mm): 7-700-736-05

Check

1. Install the Cassette Reference Plate (L)

Place the cassette reference plate (L) in the direction shown in the figure, then place it on two cassette supports.

2. Place the Reel Shift Plate Assembly in the Intermediate Position of S and L Cassette

- (1) Rotate the drive gear and place the reel shift plate assembly in the intermediate position of S and L cassettes.

Note: The reel shift plate assembly should be moved to the position where the cassette pillars do not appear from the hole of the reference plate.

- (2) Check that the S and T cassette pillars are positioned under the reference plate.

3. Check the Cassette Pillar Height

- (1) Turn the reference plate over and place it on the cassette pillars.

Note: The reference plate should be turned over because it has a concave portion at the back and cannot be adjusted correctly.

- (2) Check with an adjustment mirror that there are no clearances between the S and T cassette pillars and the reference plate.

If the specification is not satisfied, perform steps 4 through 6.

Cassette Pillar Height Check

Adjustment

4. Loosen Fixing Screw

Loosen the fixing screw of the S or T cassette pillar by one to two turns.

5. Adjust the Cassette Pillar Height

Lift the cassette pillars and press them slightly against the lower surface of the reference plate. Tighten the fixing screw under this condition.

6. Recheck the Cassette Pillar Height

Check that the height of the S and T cassette pillars satisfies the specification.

Caution

Shift the tightening position of the fixing screw when performing readjustment with the specification not satisfied. (Do not tighten the screw in the same position as previous.)

Cassette Pillar Height Adjustment

8-3-4. Reel Table Height Adjustment

Notes

- Be sure to check the height of the reel table when a reel table is removed.
- Perform the reel table height adjustment correctly.
The height of the reel table is used as the reference for the tape path.
- After supply reel table height adjustment is performed, be sure to check the video tracking. (Refer to Section 8-4-3.)

Tools

- Cassette reference plate (L)(MW-088): J-6320-880-A
- Reel table height gauge (MW-935): J-6329-350-A
- L-shaped wrench (1.5 mm): 7-700-736-05

Check

1. Install the Cassette Reference Plate (L)

Place the cassette reference plate (L) in the direction shown in the figure, then place it on two cassette supports.

2. Place the Reel Shift Plate Assembly in the L Cassette Position

Rotate the drive gear counterclockwise as far as it will go.

3. Check the Take-up Reel Table Height

- (1) Press the "T"-stamped side of the gauge against the take-up reel table from the directions indicated by the arrow.
- (2) Check that the specification is satisfied while rotating the take-up reel table clockwise by one turn.

If the specification is not satisfied, perform steps 7 and 8.

4. Check the Supply Reel Table Height

- (1) Press the "S"-stamped side of the gauge against the supply reel table from the directions indicated by the arrow.
- (2) Check that the specification is satisfied while rotating the supply reel table counterclockwise by one turn.

If the specification is not satisfied, perform steps 7 and 8.

Reel Table Height Check (L)

5. Place the Reel Shift Plate Assembly in the S Cassette Position

Rotate the drive gear clockwise as far as it will go.

6. Check the Supply and Take-up Reel Table Height

Perform in the same way as in steps 3 and 4.

If the specification is not satisfied, perform steps 7 and later.

If the specifications are satisfied in both the L and S cassette positions, perform steps 9 and later.

Reel Table Height Check (S)

Adjustment

7. Remove the Reel Table**8. Adjust the Number of Poly-slider Washers**

Adjust the number of poly-slider washers installed in the reel motor shaft so that the specifications are satisfied in both the L and S cassette positions.

9. Remove the Cassette Reference Plate (L)

Remove the cassette reference plate (L) and reel table height gauge.

10. Tighten the Screws of the Reel Table Assembly

- (1) Align the notch at the bottom of the reel table assembly with the groove position of the reel shift plate assembly.
- (2) Insert an L-shaped wrench into the notch at the bottom of the reel table assembly along the groove of the reel shift plate and tighten the two screws.

11. Recheck the Reel Table Height

Refer to steps 2 through 6.

**Reel Table Height Adjustment**

8-3-5. Reel Brake Clearance Check

Note

- Be sure to check clearance of the reel brake when the brake lining assembly is replaced or when the reel table assembly is removed.

Check

1. Check the Take-up Reel Brake Clearance

Rotate the take-up reel table counterclockwise by fingers.

At that time, check that a clearance occurs between the brake arm block and boss.

If no clearance occurs, replace the brake lining.
(Refer to Section 8-2-12.)

2. Check the Supply Reel Brake Clearance

Rotate the supply reel table clockwise by fingers.
At that time, check that a clearance occurs between the brake arm block and boss.

If no clearance occurs, replace the brake lining.
(Refer to Section 8-2-12.)

Reel Brake Clearance Check

8-3-6. Reel Brake Release Amount Adjustment

Notes

- Be sure to check the release amount of the reel brake when the brake lining assembly is replaced or when the reel table assembly is removed.
- Be sure to check the following when performing adjustment with the specification not satisfied.
 - (1) Cassette pillar height check (Refer to Section 8-3-3.)
 - (2) Reel table height check (Refer to Section 8-3-4.)

Basic knowledge

The brake lining is pressed against the reel table when the power is off.

When the power is turned on, the brake lining is released.

In the PLAY, STOP, REW, F FWD, SEARCH, and REV modes, the brake lining remains released.

Press the EJECT button to put the unit into the EJECT mode. The brake lining is pressed against the reel table a few seconds after the EJECT mode is completed.

Tool

- Wire clearance check gauge set: J-6152-450-A

Check

1. Turn the Power On

2. Check the Brake Release Amount

Check on the supply and take-up sides that the brake lining does not touch the reel table while a reel table is rotating. (Specification 1)

If specification 1 is not satisfied, perform steps 3 and later.

Reel Brake Release Amount Check

Adjustment

3. Turn the Power Off

4. Remove the Reel Shift Plate Assembly

Refer to steps 1 through 4 in Section 8-2-13.
(It is not necessary to remove a reel table.)

5. Loosen the Screws Fixing the Brake Solenoid

Loosen the two screws fixing the brake solenoid.

6. Adjust the Brake Solenoid Position

Press down the iron core of the brake solenoid to the energized position.

At that time, adjust the brake solenoid position so that the clearance between the brake lining and reel table satisfies specification 2.

Note

Press down only the iron core by a sharp-pointed stick.

Do not touch other portions.

Know-how:

- Shift the brake solenoid upward.
→ Clearance A is narrowed.
- Shift the brake solenoid downward.
→ Clearance A is widened.

7. Tighten the Screws Fixing the Brake Solenoid

Tighten the two screws loosened in step 5.

8. Recheck the Brake Release Amount

Refer to step 6.

9. Install the Reel Shift Plate Assembly

Refer to steps 12 through 22 in Section 8-2-13.
(It is not necessary to smear grease again to the slide shaft or to apply oil again to the crank arm (A).)

10. Check the Cassette Pillar Height

Refer to Section 8-3-3.

11. Check the Reel Table Height

Refer to Section 8-3-4.

Reel Brake Release Amount Adjustment

8-4. TAPE PATH ADJUSTMENT

1. Parts Location of the Tape Running System

The parts location of the tape running system is described on page 8-135.

2. Notes

(1) Cassette Compartment

- The tape path adjustment should be performed with the cassette compartment not installed in the unit. If not, the check and adjustment may be impossible.
- When the tape path adjustment is performed with the cassette compartment removed, the tape protection circuit is activated and the "ERROR" message may be displayed. In this case, turn the power off, then turn it on again.

(2) S701-1 on SS-52 board

This switch selects whether to enable the tracking control volume.

- ON (Upper position): Tracking control disabled.
- OFF (Lower position): Tracking control enabled.

After adjustment is completed, be sure to return this switch to ON (upper position).

3. Preparation

(1) Remove the rotary head cleaner. (Refer to Section 8-2-4.)

(2) Clean the following portions :

- Rotary heads (Refer to Section 7-1-2.)
- Upper drum's tape running surface (Refer to Section 7-1-3.)
- Lower drum's tape running surface and lead surface (Refer to Section 7-1-4.)
- Stationary heads (Refer to Section 7-1-5.)
- Tape running system and tape cleaner (Refer to Section 7-1-6.)

Note : The tape running condition may be difficult to check with the rotary head cleaner installed. Therefore, remove this component in advance.

4. Locking Compound

When loosening the following screws, apply locking compound to the screws after adjustment is completed.

The locking compound that applied to other surrounding parts must be wiped off with gauze or soft cloth.

- Locking compound : 7-432-114-11

5. Alignment Tape

(1) ZR2-1P

- Part No.: 8-960-073-61
- Contents:

TIME min. sec	CTL TRACK	CUE TRACK	VIDEO/AUDIO TRACK	USE
00 : 00 ↑ (7 : 3 PULSE) ↓ 15 : 00	CTL	1 kHz, 0 VU	4 MHz (A CH only)	<ul style="list-style-type: none"> • Video Tracking Adjustment • CTL Head Position Adjustment • Audio/TC Head Height Adjustment (DVW-500P) • Audio/TC Head Position Adjustment • Audio Level Check in REV Mode (DVW-500P)
20 : 00	CTL	12 kHz, 0 VU	A, C CH – 4 MHz B, D CH – 8 MHz	<ul style="list-style-type: none"> • Audio/TC Head Azimuth Adjustment (DVW-500P) • Audio/TC Head Head-to-tape Contact Adjustment (DVW-500P)
25 : 00	CTL	12 kHz, 0 VU	16 MHz (ALL CH)	
27 : 00	CTL	_____	50 % FLAT FIELD (ALL CH)	

* CTL head height adjustment can be performed at any portion of this alignment tape.

Note

When the 7:3 pulse portion is played back, the displayed TC data is interpolated by CTL signal due to no recording on the time code track.

(2) CR8-1A PS

- Part No.: 8-960-098-45
- Contents:

TIME min. sec	AUDIO TRACK	VIDEO TRACK	CTL TRACK	USE

Note

This alignment tape is not required in the DVW-500P.

8-4-1. Audio/TC Head Zenith Adjustment

Note

The audio/TC head zenith check and adjustment are not required except when the audio/TC head is replaced.

Tools

- Flatness plate (SL-657): J-6086-570-A
- Cleaning cloth: 3-184-527-01
- Cleaning fluid: 9-919-573-01

Check

1. Unthreading End Mode

Check that the unit is in the unthreading end mode.

2. Check the Audio/TC Head Zenith

- (1) Push the flatness plate lightly against the TG-4 guide and audio RP head.

Caution

Be careful not to damage the surface of the audio RP head and TG-4 guide.

- (2) Check that no clearance exists between the audio RP head and flatness plate as TG-4 guide reference in step (1).

If the specification is not satisfied, perform steps 3 and later.

If it is satisfied, perform step 7.

Audio/TC Head Zenith Check

Adjustment

3. Remove the CL Guide Rail

Remove the two screws, then remove the CL guide rail.

4. In Case Clearance Exists at the Upper Part (Fig. 1)

Turn the zenith adjustment screw counterclockwise to satisfy the specification.

5. In Case Clearance Exists at the Lower Part (Fig. 2)

Turn the zenith adjustment screw clockwise to satisfy the specification.

6. Install the CL Guide Rail

Install the CL guide rail with two screws.

7. Cleaning

Clean the surface of the audio RP head, audio erase head, and TG-4 guide with a cleaning cloth moistened with cleaning fluid.

〈Fig. 1〉

〈Fig. 2〉

* Removal/Installation of the CL Guide Rail

Audio/TC Head Zenith Adjustment

8-4-2. Tape Running Adjustment

Drum Entrance Side

Tools

- Digital Betacam cassette BCT-D32 (S cassette)
- Adjustment mirror (circular): J-6080-029-A
- Tape guide adjustment driver (MW-261): J-6322-610-A

Check

- 1. Set the S Cassette Tape**
(1) Place the reel shift plate assembly in the S cassette position.
(2) Set the BCT-D32 and put a weight on the cassette so that it does not rise up.
- 2. Turn the Power On**
- 3. PLAY Mode**
Check that the tape running condition satisfies specification 1.

If specification 1 is not satisfied, perform steps 9 and 10.
- 4. REV \times 10 Mode**
Check that the tape running condition satisfies specification 1.

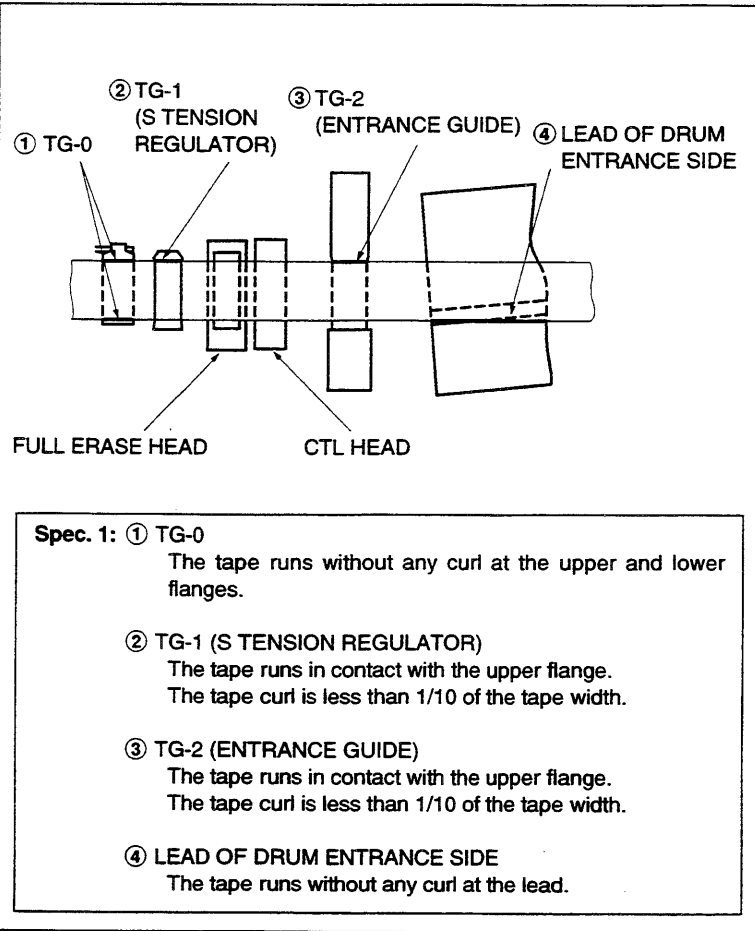

If specification 1 is not satisfied, perform steps 9 and 10.
- 5. F.FWD Mode**
Check that the tape running condition satisfies specification 1.

If specification 1 is not satisfied, perform steps 9 and 10.
- 6. REW Mode**
Check that the tape running condition satisfies specification 1.

If specification 1 is not satisfied, perform steps 9 and 10.
- 7. REV \times 1 Mode**
Check that the tape running condition satisfies specification 1.

If specification 1 is not satisfied, perform steps 9 and 10.
- 8. VAR \times -1/30 Mode**
Check that the tape running condition satisfies specification 1.

If specification 1 is not satisfied, perform steps 9 and 10.

Tape Running Check at Drum Entrance Side

Adjustment

- 9. Adjust the TG-1 and TG-2 (Entrance Guide) Height**
(1) Put the unit into the PLAY mode.
(2) Turn the height adjustment nut of TG-1 and the upper flange of TG-2 using a tape guide adjustment driver and adjust the height of TG-1 and TG-2 so that the specification 1 is satisfied.

- 10. Recheck the Tape Running at Drum Entrance Side**
Refer to steps 3 through 8.

If the specification 1 is not satisfied, perform the adjustment in step 9 again.

Tape Running Adjustment at Drum Entrance Side

Drum Exit Side

Tools

- Digital Betacam cassette BCT-D32 (S cassette)
- Digital Betacam cassette BCT-D94L (L cassette)
- Adjustment mirror (circular): J-6080-029-A
- Tape guide adjustment driver (MW-261): J-6322-610-A

Check

1. Set the S Cassette Tape

- (1) Place the reel shift plate assembly in the S cassette position.
- (2) Set the BCT-D32 and put a weight on the cassette so that it does not rise up.

2. Turn the Power On

3. PLAY Mode

Check that the tape running condition satisfies specification 2.

If specification 2 is not satisfied, perform steps 12 and 14.

4. REV × 10 Mode

Check that the tape running condition satisfies specification 2.

If specification 2 is not satisfied, perform steps 13 and 14.

5 F.FWD Mode

Check that the tape running condition satisfies specification 2.

If specification 2 is not satisfied, perform steps 12 and 14.

6. REW Mode

Check that the tape running condition satisfies specification 2.

If specification 2 is not satisfied, perform steps 12 and 14.

7. REV × 1 Mode

Check that the tape running condition satisfies specification 2.

If specification 2 is not satisfied, perform steps 12 and 14.

8. VAR × -1/30 Mode

Check that the tape running condition satisfies specification 2.

If specification 2 is not satisfied, perform steps 13 and 14.

9. Set the L Cassette Tape

- (1) Take out the BCT-D32.
- (2) Press S700 (C-1/side A) on the SS-52 board and place the reel shift plate assembly in the L cassette position.
- (3) Set the BCT-D94L and put a weight on the cassette so that it does not rise up.

10. Play Back the Tape

Play back the tape beginning portion of the BCT-D94L.

11. Check the Tape Running at the T Tape Guide of Cassette

Check that the tape running condition satisfies specification 3 at TG-10 and the T tape guide of the BCT-D94L.

If specification 3 is not satisfied, perform step 15.

Spec. 2: ⑤ LEAD OF DRUM EXIT SIDE

The tape runs without any curl at the lead.

⑥ TG-3 (EXIT GUIDE)

The tape runs in contact with the upper flange.

The tape curl is less than 1/10 of the tape width.

⑦ TG-4

The tape runs in contact with the lower flange.

The tape curl is less than 1/10 of the tape width.

⑧ TG-5 (THREADING ROLLER)

The tape runs without any curl at the upper and lower flanges.

Spec. 3: PLAY Mode

⑨ TG-10

The tape runs not in contact with the upper and lower flanges.

⑩ TAKE-UP SIDE TAPE GUIDE

The tape runs without any curl at the upper and lower portions of the tape guide.

Tape Running Check at Drum Exit Side

Adjustment

12. Adjust the TG-3 (Exit Guide) and TG-4 Height

- (1) Set the BCT-D32 and put the unit into the PLAY mode.
- (2) Turn the upper flanges of TG-3 and TG-4 using a tape guide adjustment driver and adjust the height of TG-3 and TG-4 so that the specification 2 is satisfied.

13. Adjust the TG-5 (Threading Roller) Height

(only when the specification is not satisfied in REV \times 10 mode and VAR \times -1/30 mode)

- (1) Put the unit into the EJECT mode.
- (2) Take out the cassette tape.
- (3) Turn the upper flange of TG-5 using a tape guide adjustment driver and adjust the height of TG-5 so that the specification 2 is satisfied.
- (4) Set the S cassette tape and put the unit into the REV \times 10 mode or VAR \times -1/30 mode. At this time, check that the tape running condition satisfies specification 2.

If it is not satisfied, repeat steps (1) through (4) mentioned above.

14. Recheck the Tape Running at Drum Exit Side

Refer to steps 2 through 8.

If the specification 2 is not satisfied, perform the adjustment in step 12 again.

(If the specification 2 is not satisfied in REV \times 10 mode and VAR \times -1/30 mode, perform the adjustment in step 13 again.)

15. Adjust the Slant Guide Slantness

- (1) Loosen the fixing screw of the adjustment plate by 1/4 to 1/2 turn.
- (2) Insert a 3 mm flatbladed screwdriver into the notch of the adjustment plate.
- (3) Adjust the slantness of the slant guide so that specification 3 is satisfied.
- (4) Tighten the screw loosened in step (1).
- (5) Recheck that specification 3 is satisfied referring to steps 9 through 11.

If it is not satisfied, repeat steps (1) through (5) mentioned above.

* TG-3 and TG-4 Height Adjustment/Slant Guide Slantness Adjustment

* TG-5 Height Adjustment (only when the specification is not satisfied in REV \times 10 mode and VAR \times -1/30 mode)

〈Unthreading End Mode〉

Tape Running Adjustment at Drum Exit Side

8-4-3. Video Tracking Adjustment

Note
The Y/C Head Head-to-tape Contact Check (step 15) should be performed in the DVW-A500P only. In the DVW-500P, it is not required.

Tools

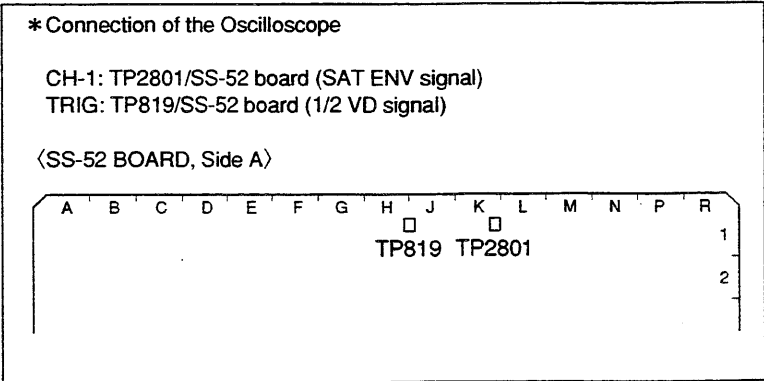

- Alignment tape ZR2-1P: 8-960-073-61
- Oscilloscope

- Alignment tape CR5-1B PS: 8-960-096-91
(Not required in the DVW-500P)

- Adjustment mirror (circular): J-6080-029-A
- Tape guide adjustment driver (MW-261): J-6322-610-A

Preparation

1. Turn the Power Off
2. Connect the Oscilloscope
CH-1: TP2801/SS-52 board (SAT ENV signal)
TRIG: TP819/SS-52 board (1/2 VD signal)
3. Set the Alignment Tape
Set the ZR2-1P and put a weight on the cassette so that it does not rise up.

Preparation

Check

4. Turn the Power On

5. PLAY Mode

- Play back the ZR2-1P (00:00 to 15:00).
- Put S701-1 on the SS-52 board to OFF (lower position) so that the tracking control volume can be operated.
- Turn RV700 (tracking control volume) on the SS-52 board and check that the output levels at the entrance and exit sides do not become higher than the output level in the center portion.

If they become higher, perform the adjustment (at the Drum Entrance Side or Drum Exit Side) in steps 16 and later.

- Turn RV700 on the SS-52 board clockwise and adjust the center portion of the RF envelope waveform so that it is 80% of the maximum output level. At that time, check that the RF envelope waveform satisfies specification 1.

If the level fluctuates, read the average level. Then turn RV700 on the SS-52 board so that the output level in the center portion of the RF envelope waveform is maximum, and check that the fluctuation amounts satisfy specification 2.

If specification 1 and 2 are not satisfied, perform the adjustment (at the Drum Entrance Side or Drum Exit Side) in steps 16 and later.

— To be continued. —

ON: upper position
(TRACKING VR operation disabled)
OFF: lower position
(TRACKING VR operation enabled)

- Alignment Tape: ZR2-1P (00: 00 to 15: 00)

Head-to-Tape Contact S701-1 : OFF

Spec. 1: $\frac{B}{A} \times 100 \geq 70\%$
 $\frac{C}{A} \times 100 \geq 70\%$
(Output levels (B and C) at the drum entrance side and exit side are more than 70% of the center level (A).)

Fluctuation S701-1 : OFF

Spec. 2: $\frac{a}{D} \times 100 \leq 20\%$
 $\frac{b}{D} \times 100 \leq 20\%$
 $\frac{c}{D} \times 100 \leq 20\%$
(Fluctuation amounts (a, b, c) at the drum center portion, entrance side and exit side are less than 20% of the average level (D).)

If the output waveform is extremely abnormal condition as shown in Fig.1 after replacing the inner drum assembly, perform the steps 1 to 5 below.

- Remove the upper drum. (Refer to steps 1 through 5 in Section 8-2-1.)
- Clean the drum support's upper drum contacting surface. (Refer to step 7 in Section 8-2-1.)
- Clean the upper drum's drum support contacting surface. (Refer to step 12 in Section 8-2-1.)
- Install the upper drum and other removed parts. (Refer to steps 13 through 19 in Section 8-2-1.)
- Check the video tracking again.

If a bamboo stick is available, it is recommended to observe the waveform while pressing the tape as shown in Fig.2 before performing the steps 1 to 5 above. If the abnormal waveform returns to the normal waveform when pressing down by bamboo stick, it shows that the tape is running apart from the drum lead without touching. In such case, reinstall the upper drum according to the steps 1 to 5 above.

<Fig. 1>

* abnormal waveform (example)

<Fig. 2>

Video Tracking Check (PLAY)

6. REV×10 Mode

- (1) Put S701-1 on the SS-52 board to ON (upper position) and fix the tracking control volume.
- (2) Play back the ZR2-1P
- (3) Put the unit into the REV×10 mode and check that the RF envelope waveform satisfies specification 3.

If specification 3 is not satisfied, perform the adjustment (at the Drum Entrance Side or Drum Exit Side) in steps 16 and later.

7. F.FWD and REW Modes

- (1) Play back the ZR2-1P
- (2) Put the unit into the F.FWD and REW modes and check that no waveform lacking exists in RF envelope waveform. (Spec. 4)

If specification 4 is not satisfied, perform the adjustment (at the Drum Entrance Side or Drum Exit Side) in steps 16 and later.

Video Tracking Check (REV x 10)

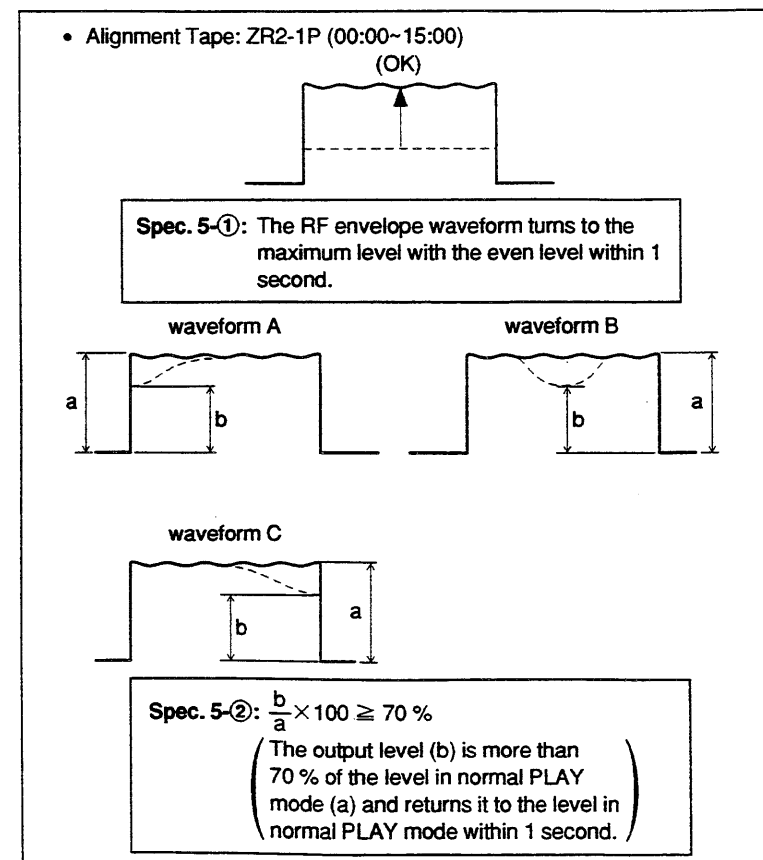

Video Tracking Check (F. FWD, REW)

8. REW Mode to PLAY Mode

- (1) Play back the ZR2-1P (00:00 to 15:00)
- (2) Put the unit into the REW mode once. Two or three seconds later, put the unit into PLAY mode. Check that the RF envelope waveform turns to the maximum level with the even level within 1 second. (Spec. 5-①)

If specification 5-② is not satisfied in waveform A or B shown in the figure, check the tape running at the drum entrance side. (Refer to Section 8-4-2.)

If specification 5-② is not satisfied in waveform C shown in the figure, check the tape running at the drum exit side. (Refer to Section 8-4-2.)

Video Tracking Check (REW → PLAY)

9. VAR×-1/30 Mode

- (1) Play back the ZR2-1P (00:00 to 15:00).
- (2) Put the unit into the VAR×-1/30 mode and check that the no waveform lacking exists, the waveform are equal, and no waveform disordered exists. (Spec. 6)

In case of the drum entrance side is no good, perform the tracking adjustment at drum entrance side. (Refer to steps 16 through 18.)

In case of the drum exit side is no good, adjust the height of TG-5 first. In case of the drum exit side is no good though TG-5 height adjustment is performed, perform the tracking adjustment at drum exit side. (Refer to steps 19 through 23.)

Check that the tape curl at the lower flange of TG-4 is less than 1/10 of the tape width (Spec. 7)

If the specification 7 is not satisfied, adjust the height of TG-5 first. In case of the drum exit side is no good though TG-5 height adjustment is performed, perform the tracking adjustment at drum exit side. (Refer to steps 19 through 23.)

10. PLAY Mode to VAR×-1/30 Mode

- (1) Play back the ZR2-1P (00:00 to 15:00).
- (2) Put the unit into the PLAY mode once. Two or three seconds later, put the unit into the VAR×-1/30 mode.

Check that the no waveform lacking exists, the waveform are equal, and no waveform disordered exists when changing the mode. (Spec. 6)

In case of the drum entrance side is no good, perform the tracking adjustment at drum entrance side. (Refer to steps 16 through 18.)

In case of the drum exit side is no good, adjust the height of TG-5 first. In case of the drum exit side is no good though TG-5 height adjustment is performed, perform the tracking adjustment at drum exit side. (Refer to steps 19 through 23.)

Check that the tape curl at the lower flange of TG-4 is less than 1/10 of the tape width. (Spec. 7)

If the specification 7 is not satisfied, adjust the height of TG-5 first. In case of the drum exit side is no good though TG-5 height adjustment is performed, perform the tracking adjustment at drum exit side. (Refer to steps 19 through 23.)

• Alignment Tape : ZR2-1P (00:00~15:00)

(OK)

Spec. 6: No waveform lacking exists.
The waveform are equal, and no waveform disordered exists.

* In case of the drum entrance side is NG (Example):

* In case of the drum exit side is NG (Example):

Spec. 7: Lower Flange of TG-4
The tape curl is less than 1/10 of the tape width.

Video Tracking Check (VAR×-1/30, VAR×-1)

11. VAR×-1 Mode

- (1) Play back the ZR2-1P (00:00 to 15:00).
- (2) Put the unit into the VAR×-1 mode, and check that the no waveform lacking exists, the waveform are equal, and no waveform disordered exists. (Spec. 6)

In case of the drum entrance side is no good, perform the tracking adjustment at drum entrance side. (Refer to steps 16 through 18.) In case of the drum exit side is no good though TG-5 height adjustment is performed, perform the tracking adjustment at drum exit side. (Refer to steps 19 through 23.)

Check that the tape curl at the lower flange of TG-4 is less than 1/10 of the tape width. (Spec. 7)

If the specification 7 is not satisfied, adjust the height of TG-5 first. In case of the drum exit side is no good though TG-5 height adjustment is performed, perform the tracking adjustment at drum exit side. (Refer to steps 19 through 23.)

12. PLAY Mode to VAR×-1 Mode

- (1) Play back the ZR2-1P (00:00 to 15:00).
- (2) Put the unit into the PLAY mode once. Two or three seconds later, put the unit into the VAR×-1 mode.

Check that no waveform lacking exists, the waveform are equal, and no waveform disordered exists when changing the mode. (Spec. 6)

In case of the drum entrance side is no good, perform the tracking adjustment at drum entrance side. (Refer to steps 16 through 18.) In case of the drum exit side is no good, adjust the height of TG-5 first. In case of the drum exit side is no good though TG-5 height adjustment is performed, perform the tracking adjustment at drum exit side. (Refer to steps 19 through 23.)

Check that the tape curl at the lower flange of TG-4 is less than 1/10 of the tape width. (Spec. 7)

If the specification 7 is not satisfied, adjust the height of TG-5 first. In case of the drum exit side is no good though TG-5 height adjustment is performed, perform the tracking adjustment at drum exit side. (Refer to steps 19 through 23.)

• Alignment Tape : ZR2-1P (00:00~15:00)

Spec. 6: No waveform lacking exists.
The waveform are equal, and no waveform disordered exists.

* In case of the drum entrance side is NG (Example):

* In case of the drum exit side is NG (Example):

Spec. 7: Lower Flange of TG-4
The tape curl is less than 1/10 of the tape width.

Video Tracking Check (VAR×-1/30, VAR×-1)

13. Check the Confidence Head Head-to-tape Contact

- (1) Connect the oscilloscope.
CH-1: TP601/EQ-45 board (CNF AC signal)
CH-2: TP701/EQ-45 board (CNF BD signal)
TRIG: TP105/EQ-45 board (CNF AC SEL signal)
- (2) Play back the ZR2-1P (20:00 to 25:00).
- (3) Put S701-1 on the SS-52 board to ON (upper position) and fix the tracking control volume.
- (4) Check that the all channels output the RF envelope waveform.

* Connection of the Oscilloscope

CH-1: TP601/EQ-45 board (CNF AC signal)
CH-2: TP701/EQ-45 board (CNF BD signal)
TRIG: TP105/EQ-45 board (CNF AC SEL signal)

〈EQ-45 BOARD, Side A〉 (Board suffix No. 15 and later)

(Board suffix No. 11, 12, 13, 22, 23, 31, 41)

〈SS-52 BOARD, Side A〉

* Alignment Tape: ZR2-1P (20:00~25:00)

Spec.8: All channels output the RF envelope waveform.

Confidence Head Head-to-tape Contact Check

14. Check the Advance Head Head-to-tape Contact

- (1) Connect the oscilloscope.
CH-1: TP401/EQ-45 board (Y/ADV AC signal)
CH-2: TP501/EQ-45 board (C/ADV BD signal)
TRIG: TP103/EQ-45 board (Y/ADV AC SEL signal)
- (2) Play back the ZR2-1P (20:00 to 25:00).
- (3) Put S701-1 on the SS-52 board to ON (upper position) and fix the tracking control volume.
- (4) Check that the all channels output the RF envelope waveform.

Advance Head Head -to-tape Contact Check

Note

Y/C Head Head-to-tape Contact Check should be performed in the DVW-A500P only. In the DVW-500P, it is not required.

15. Check the Y/C Head Head-to-tape Contact

- (1) Connect the Oscilloscope.
CH-1: TP401/EQ-45 board (Y/ADV AC signal)
CH-2: TP501/EQ-45 board (C/ADV BD signal)
TRIG: TP819/SS-52 board (1/2 VD signal)
- (2) Take out the ZR2-1P.
- (3) Set the CR5-1B PS and put a weight on the cassette so that it does not rise up.
- (4) Play back the CR5-1B PS (2:00 and later).
- (5) Put S701-1 on the SS-52 board to ON (upper position) and fix the tracking control volume.
- (6) Check that the all channels output the RF envelope waveform.

Y/C Head Head -to-tape Contact Check (only DVW-A500P)

Adjustment

Drum Entrance Side

16. Adjust the Tracking at Drum Entrance Side

- (1) Play back the ZR2-1P (00:00 to 15:00).
- (2) Put S701-1 on the SS-52 board to OFF (lower position) so that the tracking control volume can be operated.
- (3) Turn RV700 on the SS-52 board clockwise and adjust the center portion of the RF envelope waveform so that it is 80% of the maximum output level.
- (4) Loosen the upper flange of TG-2 so that the tape does not come in contact with the upper flange of TG-2.
- (5) Turn the height adjustment nut of TG-1 so that the RF envelope waveform is as shown in Fig. 1.
- (6) Turn the upper flange of TG-2 and adjust the height of TG-2 so that the RF envelope waveform is flat. (Fig. 2)

— To be continued. —

If the waveform is not flat, perform the check and adjustment below.

- ① Clean the drum lead with a bamboo stick.
(Refer to Section 7-1-4.)
 - ② Press down the tape by bamboo stick and check that the tape is running without aparting from the drum lead.
 - ③ Adjust the height of TG-2 so that the RF envelope waveform is nearly flat within the range of the specification shown in the Fig 3. At this time, do not overpress the tape at TG-2.
- (7) Check the tape running at the drum entrance side in the following modes.
- PLAY mode
 - REV × 10 mode
 - F.FWD mode
 - REW mode
 - REV × 1 mode
 - VAR × -1/30 mode

If the tape curl does not satisfy the specification at either TG-0, TG-1 or TG-2, perform the following adjustments while observing the waveform.

- ① Change the pressure against the tape at TG-1 and TG-2 within the range of the specification shown in the Fig. 1.
 - If the tape curl at TG-1 exceeds the specification described in Section 8-4-2, increase the pressure by turning the upper flange of TG-2 clockwise.
 - If the tape curl at TG-2 exceeds the specification described in Section 8-4-2, increase the pressure by turning the height adjustment nut of TG-1 clockwise.
- ② Perform the tracking adjustment again.
(Refer to step (1) through (7) mentioned above.)

17. Recheck the Video Tracking

Refer to steps 5 through 12. (page 8-98 to 8-100)

Caution

After adjustment is completed, be sure to put S701-1 on the SS-52 board to ON (upper position).

(Tape Running Check)

Spec. 1: ① TG-0

The tape runs without any curl at the upper and lower flanges.

② TG-1 (S TENSION REGULATOR)

The tape runs in contact with the upper flange.
The tape curl is less than 1/10 of the tape width.

③ TG-2 (ENTRANCE GUIDE)

The tape runs in contact with the upper flange.
The tape curl is less than 1/10 of the tape width.

④ LEAD OF DRUM ENTRANCE SIDE

The tape runs without any curl at the lead.

Tracking Adjustment at Drum Entrance Side

Drum Exit Side**18. Remove the CL Guide Rail**

Remove the two screws, then remove the CL guide rail.

Removal/Installation of the CL Guide Rail

19. Adjust the Tracking at Drum Exit Side

- (1) Play back the ZR2-1P (00:00 to 15:00).
- (2) Put S701-1 on the SS-52 board to OFF (lower position) so that the tracking control volume can be operated.
- (3) Turn RV700 on the SS-52 board clockwise and adjust the center portion of the RF envelope waveform so that it is 80% of the maximum output level.
- (4) Turn the upper flange of TG-3 counterclockwise by one to two turns so that the tape does not come in contact with the upper flange of TG-3.
- (5) Turn the upper flange of TG-4 clockwise so that the tape does not come in contact with the lower flange of TG-4.
- (6) Turn the zenith adjustment screw of the audio/TC head and adjust the RF envelope waveform so that it is 0 to 30% of the maximum output level. (Fig. 1)

At this time, check that the tape never touch both the upper flange of TG-3 and the lower flange of TG-4.

If the tape touches either flanges, repeat step (4) or (5).

If the tape follows the flanges in step (4) or (5), perform the following adjustment because the symptom indicates the too much tension either at upper or lower part of the tape caused by audio/TC head zenith.

- If the tape follows the upper flange at TG-3:
Turn the zenith adjustment screw counterclockwise.
- If the tape follows the lower flange at TG-4:
Turn the zenith adjustment screw clockwise.

- (7) Turn the upper flange of TG-3 so that it comes in contact with the tape and so that the RF envelope waveform is flat. (Fig. 2)
At that time, the tape does not contact with the lower flange of TG-4.

— To be continued. —

〈SS-52 BOARD, Side A〉

- Alignment Tape: ZR2-1P (00:00~15:00)

〈Fig. 1〉

If the pressure against the tape at TG-3 is too much, the waveform become as shown in the right figure. (NG)

〈Fig. 2〉

If the waveform is not flat, perform the check and adjustment below.

- ① Clean the drum lead with a bamboo stick.
(Refer to Section 7-1-4.)
 - ② Press down the tape by bamboo stick and check that the tape is running without aparting from the drum lead.
 - ③ Adjust the height of TG-3 so that the RF envelope waveform is nearly flat within the range of the specification shown in the Fig.3. At this time, do not overpress the tape at TG-3.
- (8) Adjust the height of TG-4 so that the lower flange of TG-4 comes in contact with the tape.
 - (9) Check the tape running at the drum exit side in the following modes.
 - PLAY mode
 - REV × 10 mode
 - F.FWD mode
 - REW mode
 - REV × 1 mode
 - VAR × -1/30 mode

If the tape curl does not satisfy the specification at TG-3, perform the following adjustments while observing the waveform.

- ① Change the zenith of the audio/TC head within the range of the specification shown in Fig. 1.
- ② Perform the tracking adjustment again.
(Refer to step (1) through (9) mentioned above.)

20. Recheck the Video Tracking

Refer to steps 5 through 12. (Page 8-98 through 8-100)

21. Install the CL Guide Rail

Install the CL guide rail with two screws.

Caution

After adjustment is completed, be sure to put S701-1 on the SS-52 board to ON (upper position).

〈Fig. 3〉

〈Tape Running Check〉

Spec. 2: ⑤ LEAD OF DRUM EXIT SIDE

The tape runs without any curl at the lead.

⑥ TG-3 (EXIT GUIDE)

The tape runs in contact with the upper flange.

The tape curl is less than 1/10 of the tape width.

⑦ TG-4

The tape runs in contact with the lower flange.

The tape curl is less than 1/10 of the tape width.

⑧ TG-5 (THREADING ROLLER)

The tape runs without any curl at the upper and lower flanges.

Tracking Adjustment at Drum Exit Side

8-4-4. CTL Head Height Adjustment

Tools

- Alignment tape ZR2-1P: 8-960-073-61
- Oscilloscope
- Tape guide adjustment driver (MW-261): J-6322-610-A

Preparation

1. **Turn the Power Off**
2. **Connect the Oscilloscope**
CH-1: TP800/SS-52 board (CTL signal)
TRIG: TP819/SS-52 board (1/2 VD signal)
3. **Set the Alignment Tape**
Set the ZR2-1P and put a weight on the cassette so that it does not rise up.

* Connection of the Oscilloscope

CH-1: TP800/SS-52 board (CTL signal)
TRIG: TP819/SS-52 board (1/2 VD signal)

〈SS-52 BOARD, Side A〉

Preparation

Check

4. **Turn the Power On**
5. **Play Back the Alignment Tape**
Play back the ZR2-1P.
6. **Check the CTL Head Height**
 - (1) Check that the level decreases when portion A of the tape shown in the figure is pressed down.

If the level increases, perform step 7.
 - (2) Check that the level decreases when portion B of the tape is pushed up.

If the level increases, perform step 8.

* Alignment Tape : ZR2-1P

Spec.: The level decreases when pressing down and pushing up the alignment tape.

CTL Head Height Check

Adjustment

7. In Case the Level Increases when the Tape is Pressed Down (Fig. 1)

Turn the adjustment nut counterclockwise and adjust so that the output waveform is maximum.

8. In Case the Level Increases when the Tape is Pushed Up (Fig. 2)

Turn the adjustment nut clockwise and adjust so that the output waveform is maximum.

〈Fig. 1〉

〈Fig. 2〉

CTL Head Height Adjustment

8-4-5. CTL Head Position Adjustment

Note

The CTL head position adjustment is closely related to the audio/TC head position adjustment.

Be sure to confirm the audio/TC head position when the CTL head position is adjusted.

Tools

- Alignment tape ZR2-1P: 8-960-073-61
- Oscilloscope

Preparation

1. Turn the Power Off

2. Connect the Oscilloscope

CH-1: TP2801/SS-52 board (SAT ENV signal)
 CH-2: TP819/SS-52 board (1/2 VD signal)
 CH-3: TP101/EQ-45 board (REC AC SEL signal)
 TRIG: TP819/SS-52 board (1/2 VD signal)

3. Set the Alignment Tape

Set the ZR2-1P and put a weight on the cassette so that it does not rise up.

* Connection of the Oscilloscope

CH-1: TP2801/SS-52 board (SAT ENV signal)
 CH-2: TP819/SS-52 board (1/2 VD signal)
 CH-3: TP101/EQ-45 board (REC AC SEL signal)
 TRIG: TP819/SS-52 board (1/2 VD signal)

〈SS-52 BOARD, Side A〉

〈EQ-45 BOARD, Side A〉 (Board suffix No. 15 and later)

(Board suffix No. 11, 12, 13, 22, 23, 31, 41)

Preparation

Check

4. Turn the Power On**5. Play Back the Alignment Tape**

Play back the ZR2-1P (00:00 to 15:00).

6. Check the CTL Head Position

- (1) Put S701-1 on the SS-52 board to OFF (lower position) so that the tracking control volume can be operated.
- (2) Turn RV700 (tracking control volume) on the SS-52 board so that the output level in the center portion of the RF envelope waveform is maximum. At that time, check that the marker is located in the rising portion of 1/2 VD signal.
- (3) Put S701-1 on the SS-52 board to ON (upper position) and fix the tracking control volume.
- (4) Check that the output level in the center portion of the RF envelope waveform satisfies the specification.

If the specification is not satisfied, perform steps 7 and later.

* Alignment Tape: ZR2-1P (00:00 to 15:00)

CTL Head Position Check

Adjustment

7. Loosen the Screw

Loosen the fixing screw of the CTL/FE head assembly by 1/4 to 1/2 turn.

8. Adjust the CTL Head Position

- (1) Insert a 3 mm flatbladed screwdriver into the notch of the CTL/FE head assembly.
- (2) Adjust the CTL/FE head assembly position so that the output level in the center portion is maximum and the marker of RF envelope waveform is located in the rising portion of 1/2 VD signal.

9. Tighten the Screw

Tighten the screw loosened in step 7.

10. Recheck the CTL Head Position

Refer to steps 5 and 6.

In case the adjustment is performed

11. Adjust the Audio/TC Head Position

Refer to Section 8-4-9.

Caution

After adjustment is completed, be sure to put S701-1 on the SS-52 board to ON (upper position).

CTL Head Position Adjustment

8-4-6. Audio/TC Head Height Adjustment

For DVW-A500P

Note

The audio/TC head height adjustment is closely related to the azimuth adjustment, head-to-tape contact adjustment, and head position adjustment. Be sure to perform adjustments (or checks) according to "In case the adjustment is performed" in this section when the audio/TC head height is adjusted.

Tools

- Alignment tape CR8-1A PS: 8-960-098-45
- Oscilloscope

Preparation

1. Turn the Power Off
2. Connect the Oscilloscope
CH-1: TP103/AP-28 board (CH-1 PB signal)
CH-2: TP203/AP-28 board (CH-2 PB signal)
3. Set the Alignment Tape
Set the CR8-1A PS and put a weight on the cassette so that it does not rise up.

* Connection of the Oscilloscope

CH-1: TP103/AP-28 board (CH-1 PB signal)
CH-2: TP203/AP-28 board (CH-2 PB signal)

〈AP-28 BOARD, Side A〉

Preparation (DVW-A500P)

Check

4. Turn the Power On

5. Play Back the Alignment Tape

Play back the 1 kHz, 0 VU signal portion (8:00 to 10:00) on the CR8-1A PS.

6. Check the Audio/TC Head Height

- (1) Check that both levels in CH-1 and CH-2 decrease when portion A of the tape shown in the figure is pressed down.

If both levels increase, perform step 7.

- (2) Check that both levels in CH-1 and CH-2 decrease when portion B of the tape is pushed up.

If both levels increase, perform step 8.

* Alignment Tape: CR8-1A PS (8:00 to 10:00)

〈Audio Output Waveform〉

Spec. : The portion A widens when pressing down and pushing up the alignment tape.

Audio/TC Head Height Check (DVW-A500P)

Adjustment**7. In Case both Levels Increase when the Tape is Pressed Down (Fig. 1)**

Turn the height adjustment screw clockwise and adjust so that both output waveforms in CH-1 and CH-2 are maximum.

8. In Case both Levels Increase when the Tape is Pushed Up (Fig. 2)

Turn the height adjustment screw counterclockwise and adjust so that both output waveforms in CH-1 and CH-2 are maximum.

In case the adjustment is performed**9. Adjust the Audio/TC Head Azimuth**

Refer to Section 8-4-7 (For DVW-A500P).

10. Adjust the Audio/TC Head Head-to-tape Contact

Refer to Section 8-4-8 (For DVW-A500P).

11. Check the Audio/TC Head Azimuth

Refer to Section 8-4-7 (For DVW-A500P).

12. Adjust the Audio/TC Head Position

Refer to Section 8-4-9.

13. Check the Audio/TC Head Height

Refer to steps 5 and 6 in this section.

14. Check the Audio/TC Head Azimuth

Refer to Section 8-4-7 (For DVW-A500P).

<Fig. 1>**HEIGHT ADJUSTMENT SCREW****<Fig. 2>****HEIGHT ADJUSTMENT SCREW**

For DVW-500P

Note

The audio/TC head height adjustment is closely related to the azimuth adjustment, head-to-tape contact adjustment, and head position adjustment.
Be sure to perform adjustments (or checks) according to "In case the adjustment is performed" in this section when the audio/TC head height is adjusted.

Tools

- Alignment tape ZR2-1P: 8-960-073-61
- Oscilloscope

Preparation

1. **Turn the Power Off**
2. **Connect the Oscilloscope**
CH-1: AUDIO OUTPUT CUE connector/
connector panel
or
TP701/CUE-1 board (CUE OUT signal)
3. **Play Back the Alignment Tape**
Set the ZR2-1P and put a weight on the cassette so that it does not rise up.

Check

4. **Turn the Power On**
5. **Play Back the Alignment Tape**
Play back the 1 kHz, 0 VU signal portion (00:00 to 15:00) on the ZR2-1P.
6. **Check the Audio/TC Head Height**
 - (1) Check that the level decreases when portion A of the tape shown in the figure is pressed down.

If the level increases, perform step 7.
 - (2) Check that the level decreases when portion B of the tape is pushed up.

If the level increases, perform step 8.

* Alignment Tape: ZR2-1P (00:00 to 15:00)

Spec. : The level decreases when pressing down and pushing up the alignment tape.

Adjustment

7. **In Case the Level Increases when the Tape is Pressed Down (Fig. 1)**
Turn the height adjustment screw clockwise and adjust so that the output waveform is maximum.
8. **In Case the Level Increases when the Tape is Pushed Up (Fig. 2)**
Turn the height adjustment screw counterclockwise and adjust so that the output waveform is maximum.

In case the adjustment is performed

9. **Adjust the Audio/TC Head Azimuth**
Refer to Section 8-4-7 (For DVW-500P).
10. **Adjust the Audio/TC Head Head-to-tape Contact**
Refer to Section 8-4-8 (For DVW-500P).
11. **Check the Audio/TC Head Azimuth**
Refer to Section 8-4-7 (For DVW-500P).
12. **Adjust the Audio/TC Head Position**
Refer to Section 8-4-9.
13. **Check the Audio/TC Head Height**
Refer to steps 5 and 6 in this section.
14. **Check the Audio/TC Head Azimuth**
Refer to Section 8-4-7 (For DVW-500P).

〈Fig. 1〉

〈Fig. 2〉

Audio/TC Head Height Adjustment (DVW-500P)

8-4-7. Audio/TC Head Azimuth Adjustment**For DVW-A500P****Note**

The audio/TC head azimuth adjustment is closely related to the head-to-tape contact adjustment, head position adjustment, and head height adjustment.
Be sure to perform adjustments (or checks) according to "In case the adjustment is performed" in this section when the audio/TC head azimuth is adjusted.

Tools

- Alignment tape CR8-1A PS: 8-960-098-45
- Oscilloscope

Preparation

- 1. Turn the Power Off**
- 2. Connect the Oscilloscope**
CH-1: TP103/AP-28 board (CH-1 PB signal)
CH-2: TP203/AP-28 board (CH-2 PB signal)
- 3. Set the Alignment Tape**
Set the CR8-1A PS and put a weight on the cassette so that it does not rise up.

*** Connection of Oscilloscope**

CH-1: TP103/AP-28 board (CH-1 PB signal)
CH-2: TP203/AP-28 board (CH-2 PB signal)

〈AP-28 BOARD, Side A〉

**Preparation (DVW-A500P)**

Check

4. Turn the Power On**5. Play Back the Alignment Tape**

Play back the 10 kHz, -10 VU signal portion (3:00 to 4:55) on the CR8-1A PS.

6. Check the Audio/TC Head Azimuth

- (1) Output a lissajous waveform so that the amplitudes in the horizontal and vertical directions are 6 cm each.
- (2) Check that the vertical amplitude at the center point in the horizontal direction satisfies the specification.

If the specification is not satisfied, perform steps 7 and later.

- (3) Strike the portions A and B shown in the figure lightly with the tip of a screwdriver. Then check that the specification is satisfied.

* Alignment Tape: CR8-1A PS (3:00 to 4:55)

〈Lissajous Waveform〉

Spec. : $A \leq 0.52\text{cm}$
--

Audio/TC Head Azimuth Check (DVW-A500P)

Adjustment

7. Adjust the Audio/TC Head Azimuth

- (1) Turn the azimuth adjustment screw clockwise and adjust so that the specification is satisfied.
- (2) Strike the portions A and B shown in the figure lightly with the tip of a screwdriver. Then check that the specification is satisfied.

In case the adjustment is performed

8. Adjust the Audio/TC Head Head-to-tape Contact

Refer to Section 8-4-8 (For DVW-A500P).

9. Check the Audio/TC Head Azimuth

Refer to steps 5 and 6 in this section.

10. Adjust the Audio/TC Head Position

Refer to Section 8-4-9.

11. Check the Audio/TC Head Height

Refer to Section 8-4-6 (For DVW-A500P).

12. Check the Audio/TC Head Azimuth

Refer to steps 5 and 6 in this section.

Audio/TC Head Azimuth Adjustment (DVW-A500P)

For DVW-500P**Note**

The audio/TC head azimuth adjustment is closely related to the head-to-tape contact adjustment, head position adjustment, and head height adjustment.

Be sure to perform adjustments (or checks) according to "In case the adjustment is performed" in this section when the audio/TC head azimuth is adjusted.

Tools

- Alignment tape ZR2-1P: 8-960-073-61
- Oscilloscope

Preparation

1. **Turn the Power Off**
2. **Connect the Oscilloscope**
CH-1: AUDIO OUTPUT CUE connector/
connector panel
or
TP701/CUE-1 board (CUE OUT signal)
3. **Set the Alignment Tape**
Set the ZR2-1P and put a weight on the cassette so that it does not rise up.

Adjustment

4. **Turn the Power On**
5. **Play Back the Alignment Tape**
Play back the 12 kHz, 0 VU signal portion (15:00 to 25:00) on the ZR2-1P.
6. **Adjust the Audio/TC Head Azimuth**
 - (1) Turn the azimuth adjustment screw and adjust so that the output waveform is maximum.
 - (2) Strike the portions A and B shown in the figure lightly with the tip of a screwdriver. Then the level remains maximum.
7. **Adjust the Audio/TC Head Head-to-tape Contact**
Refer to Section 8-4-8 (For DVW-500P).
8. **Adjust the Audio/TC Head Position**
Refer to Section 8-4-9.
9. **Check the Audio/TC Head Height**
Refer to Section 8-4-6 (For DVW-500P).

* Alignment Tape : ZR2-1P (15:00 to 25:00)

8-4-8. Audio/TC Head Head-to-tape Contact Adjustment**For DVW-A500P****Note**

The audio/TC head head-to-tape contact adjustment is closely related to the head position adjustment, head height adjustment, and head azimuth adjustment. Be sure to perform adjustments (or checks) according to "In case the adjustment is performed" in this section when the audio/TC head head-to-tape contact is adjusted.

Tools

- Alignment tape CR8-1A PS: 8-960-098-45
- Oscilloscope
- Torque screwdriver (6 kg·cm) (JB-5251): J-6252-510-A
- Torque screwdriver's bit (+2 mm, l= 75 mm): J-6323-420-A

Preparation

1. **Turn the Power Off**
2. **Connect the Oscilloscope**
 CH-1: TP103/AP-28 board (CH-1 PB signal)
 CH-2: TP203/AP-28 board (CH-2 PB signal)
3. **Set the Alignment Tape**
 Set the CR8-1A PS and put a weight on the cassette so that it does not rise up.

*** Connection of Oscilloscope**

CH-1: TP103/AP-28 board (CH-1 PB signal)
 CH-2: TP203/AP-28 board (CH-2 PB signal)

〈AP-28 BOARD, Side A〉

**Preparation (DVW-A500P)**

Check

4. Turn the Power On

5. Play Back the Alignment Tape

Play back the 10 kHz, -10 VU signal portion (3:00 to 4:55) on the CR8-1A PS.

6. Check the Audio/TC Head Head-to-tape Contact

- (1) Push portions A and B of the tape shown in the figure slightly.
- (2) Check that both increase values of the output levels in CH-1 and CH-2 satisfy the specification.

If the specification is not satisfied, perform step 7 and later.

* Alignment Tape : CR8-1A PS (3:00 to 4:55)

〈Audio Output Waveform〉

Spec. : Both increase values of the output levels in CH-1 and CH-2 are within 5%.

Audio/TC Head Head-to-tape Contact Check (DVW-A500P)

Adjustment

7. Loosen the Screws

Loosen the two head fixing screws by 1/4 to 1/2 turn.

8. Adjust the Audio/TC Head Head-to-tape Contact

- (1) Insert a 2 mm flatbladed screwdriver into the notch of the adjustment plate.
- (2) Adjust the audio/TC head position so that the output waveform is maximum.

9. Tighten the Screws

Tighten the two fixing screws loosened in step 7.

Tightening torque: $19.6 \times 10^{-2} \text{ N}\cdot\text{m}$ (2 kgf·cm)

10. Recheck the Audio/TC Head Head-to-tape Contact

Refer to steps 5 and 6 in this section.

In case the adjustment is performed

11. Check the Audio/TC Head Position

Refer to Section 8-4-9.

12. Check the Audio/TC Head Height

Refer to Section 8-4-6 (For DVW-A500P).

13. Check the Audio/TC Head Azimuth

Refer to Section 8-4-7 (For DVW-A500P).

Audio/TC Head Head-to-tape Contact Adjustment (DVW-A500P)

For DVW-500P

Note

The audio/TC head head-to-tape contact adjustment is closely related to the head position adjustment, head height adjustment, and head azimuth adjustment. Be sure to perform adjustments (or checks) according to "In case the adjustment is performed" in this section when the audio/TC head head-to-tape contact is adjusted.

Tools

- Alignment tape ZR2-1P: 8-960-073-61
- Oscilloscope
- Torque screwdriver (6 kg•cm)(JB-5251): J-6252-510-A
- Torque screwdriver's bit (+2 mm, l= 75 mm): J-6323-420-A

Preparation

1. **Turn the Power Off**
2. **Connect the Oscilloscope**
CH-1: AUDIO OUTPUT CUE connector/
connector panel
or
TP701/CUE-1 board (CUE OUT signal)
3. **Set the Alignment Tape**
Set the ZR2-1P and put a weight on the cassette so that it does not rise up.

Check

4. **Turn the Power On**
5. **Play Back the Alignment Tape**
Play back the 12 kHz, 0 VU signal portion (15:00 to 25:00) on the ZR2-1P.
6. **Check the Audio/TC Head Head-to-tape Contact**
 - (1) Push portions A and B of the tape shown in the figure slightly.
 - (2) Check that the increase value in the output level satisfies the specification.

If the specification is not satisfied, perform step 7 and later.

* Alignment Tape : ZR2-1P (15:00 to 25:00)

Spec. : The increase value of the output level is within 5%.

Audio/TC Head Head-to-tape Contact Check (DVW-500P)

Adjustment

7. Loosen the Screws

Loosen the two head fixing screws by 1/4 to 1/2 turn.

8. Adjust the Audio/TC Head Head-to-tape Contact

- (1) Insert a 2 mm flatbladed screwdriver into the notch of the adjustment plate.
- (2) Adjust the audio/TC head position so that the output waveform is maximum.

9. Tighten the Screws

Tighten the two fixing screws loosened in step 7.

Tightening torque: $19.6 \times 10^{-2} \text{ N}\cdot\text{m}$ (2 kgf·cm)

10. Recheck the Audio/TC Head Head-to-tape Contact

Refer to steps 5 and 6 in this section.

In case the adjustment is performed

11. Check the Audio/TC Head Position

Refer to Section 8-4-9.

12. Check the Audio/TC Head Height

Refer to Section 8-4-6 (For DVW-500P).

13. Check the Audio/TC Head Azimuth

Refer to Section 8-4-7 (For DVW-500P).

Audio/TC Head Head-to-tape Contact Adjustment (DVW-500P)

8-4-9. Audio/TC Head Position Adjustment

Notes

- The CTL head position adjustment must have been completed before performing this adjustment. The audio/TC head position is adjusted with the CTL head position as reference.
- The audio/TC head position adjustment is closely related to the head height adjustment, head azimuth adjustment, and head-to-tape contact adjustment. Be sure to perform adjustments (or checks) according to "In case the adjustment is performed" in this section when the audio/TC head position is adjusted.

Tools

- Alignment tape ZR2-1P: 8-960-073-61
- Oscilloscope

Preparation

1. **Turn the Power Off**
2. **Connect the Oscilloscope**
CH-1: TP815/SS-52 board (CTL PULSE signal)
CH-2: TP2800/SS-52 board (PB LTC signal)
3. **Set the Alignment Tape**
Set the ZR2-1P and put a weight on the cassette so that it does not rise up.

Check

4. **Turn the Power On**
5. **Play Back the Alignment Tape**
Play back the ZR2-1P (00:00 to 15:00).
6. **Check the Audio/TC Head Position**
Check that the positional relationship between the rising edges of CTL and TC signals satisfies the specification.

If the specification is not satisfied, perform steps 7 and later.

* Connection of the Oscilloscope

CH-1: TP815/SS-52 board (CTL PULSE signal)
CH-2: TP2800/SS-52 board (PB LTC signal)

〈SS-52 BOARD, Side A〉

Preparation

* Alignment Tape: ZR2-1P (00:00 to 15:00)

Audio/TC Head Position Check

Adjustment

7. Remove the CL Guide Rail

Remove the two screws, then remove the CL guide rail.

8. Loosen the Screws

Loosen the two fixing screws of the audio/TC head assembly by 1/4 to 1/2 turn.

9. Adjust the Audio/TC Head Position

- (1) Insert a 3 mm flatbladed screwdriver into the notch of the audio/TC head assembly.
- (2) Adjust the audio/TC head assembly position so that the specification is satisfied.

10. Tighten the Screws

Tighten the two screws loosened in step 8.

11. Recheck the Audio/TC Head Position

Refer to steps 5 and 6 in this section.

12. Install the CL Guide Rail

Install the CL guide rail with two screws.

In case the adjustment is performed

13. Check the Audio/TC Head Height

Refer to Section 8-4-6 (For DVW-A500P or For DVW-500P).

14. Check the Audio/TC Head Azimuth

Refer to Section 8-4-7 (For DVW-A500P or For DVW-500P).

15. Check the Audio/TC Head Head-to-tape Contact

Refer to Section 8-4-8 (For DVW-A500P or For DVW-500P).

16. Check the Audio/TC Head Position

Refer to steps 5 and 6 in this section.

Audio/TC Head Position Adjustment

8-4-10. Audio Level Adjustment in REV Mode

For DVW-A500P

Tools

- Alignment tape CR8-1A PS: 8-960-098-45
- Oscilloscope
- Digital Betacam cassette BCT-D32 (S cassette)
- Adjustment mirror (circular): J-6080-029-A
- Tape guide adjustment driver (MW-261): J-6322-610-A

Preparation

1. **Turn the Power Off**
2. **Connect the Oscilloscope**
CH-1: TP203/AP-28 board (CH-2 PB signal)
3. **Set the Alignment Tape**
Set the CR8-1A PS and put a weight on the cassette so that it does not rise up.

* Connection of the Oscilloscope

CH-1: TP203/AP-28 board (CH-2 PB signal)

〈AP-28 BOARD, Side A〉

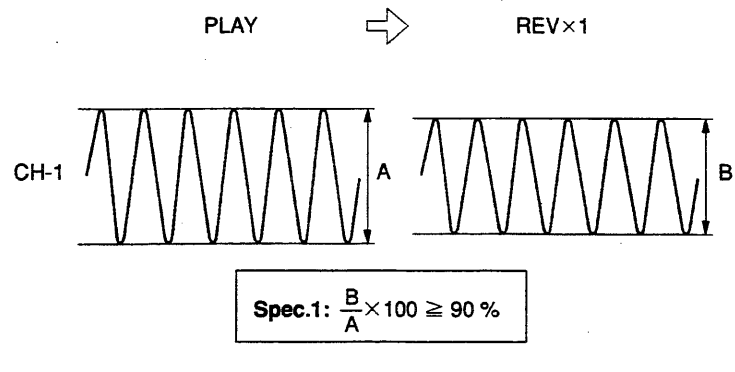

Preparation (DVW-A500P)

Check

4. **Turn the Power On**
5. **Play Back the Alignment Tape**
Play back the 1 kHz, 0 VU signal portion (8:00 to 10:00) on the CR8-1A PS.
6. **Check the Audio Output Level**
Check the audio output level A in CH-1.
7. **Put the Unit into the REV × 1 Mode**
8. **Check the Audio Output Level**
Check that the audio output level B in CH-1 satisfies specification 1.

If specification 1 is not satisfied, perform steps 9 and later.

* Alignment Tape: CR8-1A PS (8:00 to 10:00)

Audio Level Check in REV Mode (DVW-A500P)

Adjustment

9. Adjust the TG-5 (Threading Roller) Height

- (1) Play back the 1 kHz, 0VU signal portion (8:00 to 10:00) on the CR8-1A PS.
- (2) Put the unit into the REV x 1 mode.
- (3) In case the level increases when portion A of the tape shown in the figure is pressed down, turn the upper flange of TG-5 clockwise using a tape guide adjustment driver.
In case the level increases when portion B is pushed up, turn the upper flange of TG-5 counterclockwise.
- (4) Check the audio output level satisfies specification 1. (Refer to steps 5 through 8.)

If the specification 1 is not satisfied, repeat steps (1) through (4) mentioned above.

10. Check the Tape Running at Drum Exit Side

In the modes below, check that the tape running condition satisfies specification 2.

- (1) PLAY mode
- (2) REV x 10 mode
- (3) REV x 1 mode

If specification 2 is not satisfied, adjust the tape guides height at the drum exit side. (Refer to steps 12 through 14 (at the Drum Exit Side) in Section 8-4-2.)

If the height of the tape guide is adjusted, perform the video tracking check. (Refer to Section 8-4-3.)

Audio Level Adjustment in REV Mode (DVW-A500P)

For DVW-500P**Tools**

- Alignment tape ZR2-1P: 8-960-073-61
- Oscilloscope
- Digital Betacam cassette BCT-D32 (S cassette)
- Adjustment mirror (circular): J-6080-029-A
- Tape guide adjustment driver (MW-261): J-6322-610-A

Preparation

1. **Turn the Power Off**
2. **Connect the Oscilloscope**
CH-1: AUDIO OUTPUT CUE connector/
connector panel
or
TP701/CUE-1 board (CUE OUT signal)
3. **Set the Alignment Tape**
Set the ZR2-1P and put a weight on the cassette so that it does not rise up.

Check

4. **Turn the Power On**
5. **Play Back the Alignment Tape**
Play back the 1 kHz, 0 VU signal portion (00:00 to 15:00) on the ZR2-1P.
6. **Check the Cue Output Level**
Check the cue output level A.
7. **Put the Unit into the REV × 1 Mode**
8. **Check the Cue Output Level**
Check that the cue output level B satisfies specification 1.

If specification 1 is not satisfied, perform steps 9 and later.

**Audio Level Check in REV Mode (DVW-500P)**

Adjustment

9. Adjust the TG-5 (Threading Roller) Height

- (1) Play back the 1 kHz, 0VU signal portion (00:00 to 15:00) on the ZR2-1P.
- (2) Put the unit into the REV x 1 mode.
- (3) In case the level increases when portion A of the tape shown in the figure is pressed down, turn the upper flange of TG-5 clockwise using a tape guide adjustment driver.
- In case the level increases when portion B is pushed up, turn the upper flange of TG-5 counterclockwise.
- (4) Check the cue output level satisfies specification 1. (Refer to steps 5 through 8.)

If the specification 1 is not satisfied, repeat steps (1) through (4) mentioned above.

10. Check the Tape Running at Drum Exit Side

In the modes below, check that the tape running condition satisfies specification 2.

- (1) PLAY mode
- (2) REV x 10 mode
- (3) REV x 1 mode

If specification 2 is not satisfied, adjust the tape guides height at the drum exit side. (Refer to steps 12 through 14 (at the Drum Exit Side) in Section 8-4-2.)

If the height of the tape guide is adjusted, perform the video tracking check. (Refer to Section 8-4-3.)

Spec. 2: ⑤ LEAD OF DRUM EXIT SIDE

The tape runs without any curl at the lead.

⑥ TG-3 (EXIT GUIDE)

The tape runs in contact with the upper flange.
The tape curl is less than 1/10 of the tape width.

⑦ TG-4

The tape runs in contact with the lower flange.
The tape curl is less than 1/10 of the tape width.

⑧ TG-5 (THREADING ROLLER)

The tape runs without any curl at the upper and lower flanges.

Audio Level Adjustment in REV Mode (DVW-500P)

Parts Location of the Tape Running System

8-5. SERVO/DT AND RF ADJUSTMENT

Adjustment of each item is performed by using maintenance mode. Refer to section 5 for how to operate the maintenance mode.

System Setup Panel

How to operate the maintenance mode

Push ⑧ S300(DIAG/ADJUST 1) (M-1) on the SS-52 board to enter the maintenance mode.

How to enter the next menu:

Press the ⑥ JOG button once. (Enters JOG mode.)
Turn the ⑦ search dial to move the * mark to a desired item.
Press the ③ SET button.

How to exit the current menu or the maintenance mode:

Press the ② MENU button.

How to operate a tape (e.g. PLAY) in the manual adjustment or other items:

Press the ③ SET button to exit the maintenance mode temporarily. (A tape can be operated in this condition.)
Press the ② MENU button to return to the maintenance mode.

How to change the data (adjust the level) manually:

Turn the ⑦ search dial to move the * mark to the item wishing to be adjusted.
Turn the ⑦ search dial while pressing the ⑥ JOG button.

How to save the data:

Turn the ⑦ search dial to move the * mark to "A??: NV-RAM CONTROL".
Press the ③ SET button.
Turn the ⑦ search dial to move the * mark to "SAVE ALL ADJUST DATA".
Press the ③ SET button.

8-5-1. Drum Phase Adjustment

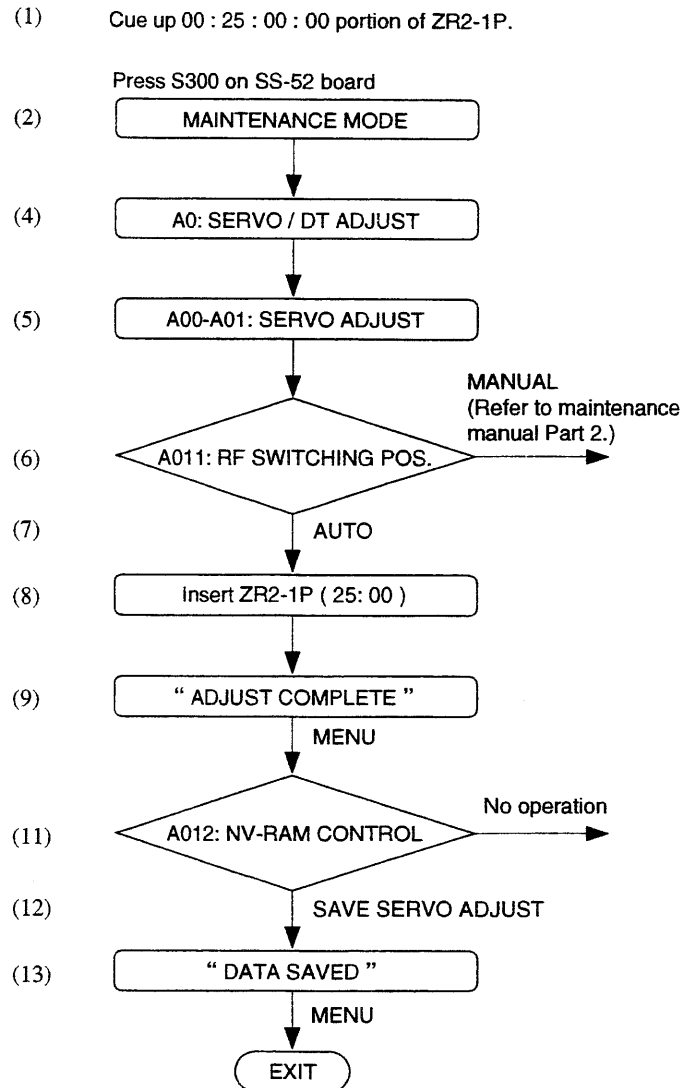

- (1) Prepare the alignment tape ZR2-1P which is cue upped the 00:25:00:00 portion by the time code.
- (2) Press S300 switch on the SS-52 board to enter the maintenance mode.
- (3) Move the * mark to "A0 : SERVO/DT ADJUST" by the search dial.
- (4) Press the SET button to enter "A0 : SERVO/DT ADJUST" mode.

From this time on, operate the menu in the same way.

- (5) Enter "A00-01 : SERVO ADJUST" menu.
- (6) Enter "A011 : RF SWITCHING POS.".
- (7) Select "AUTO" by turning the search dial while pressing the JOG button.
- (8) Insert the alignment tape ZR2-1P as instructed by monitor display and execute the automatic adjustment.
- (9) After adjustment is completed, "ADJUST COMPLETE" is displayed.
- (10) Press the MENU button to return to the SERVO ADJUST display.
- (11) Enter "A012 : NV-RAM CONTROL" menu.
- (12) Select "SAVE SERVO ADJUST DATA".
- (13) After adjustment data are saved in NV-RAM completely, "DATA SAVED" is displayed.
- (14) Press the MENU button several times to return to the operation mode.

Note

When adjustment is incomplete at "A011 : RF SWITCH POS", error message is displayed. As for error message, refer to section 5-7-1. Servo System Adjustment Mode.

8-5-2. Digital DT Adjustment

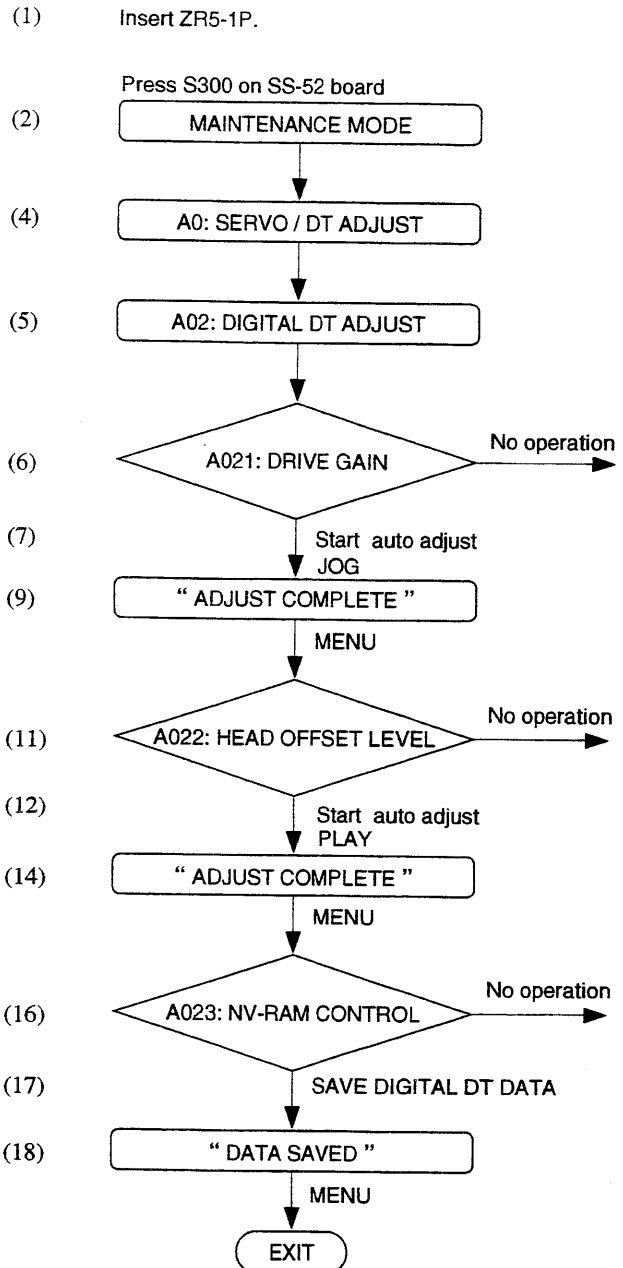

- (1) Insert the alignment tape ZR5-1P.
- (2) Press S300 switch on the SS-52 board to enter the maintenance mode.
- (3) Move the * mark to "A0 : SERVO/DT ADJUST" by the search dial.
- (4) Press the SET button to enter "A0 : SERVO/DT ADJUST" mode.

From this time on, operate the menu in the same way.

- (5) Enter "A02 : DIGITAL DT ADJUST" menu.
- (6) Enter "A021 : DRIVE GAIN".
- (7) Select "Start auto adjust".
- (8) Put the unit into the STILL mode by pressing the JOG button as instructed by monitor display.
- (9) After adjustment is completed, "ADJUST COMPLETE" is displayed.
- (10) Press the MENU button to return to the DIGITAL ADJUST display.
- (11) Enter "A022:HEAD OFFSET LEVEL".
- (12) Select "Start auto adjust".
- (13) Put the unit into the PLAY mode by pressing the PLAY button as instructed by monitor display.
- (14) After adjustment is completed, "ADJUST COMPLETE" is displayed.
- (15) Press the MENU button to return to DIGITAL ADJUST display.
- (16) Enter "A023 : NV-RAM CONTROL".
- (17) Execute "SAVE DIGITAL DT ADJUST".
- (18) After adjustment data are saved in NV-RAM completely, "DATA SAVED" is displayed.
- (19) Press the MENU button several times to return to the operation mode.

Note

When adjustment is incomplete at "A021 : DRIVE GAIN" or "A022 : HEAD OFFSET LEVEL", "ADJUST INCOMPLETE" is displayed. Refer to section 5-2-6. Digital DT System Check.

8-5-3. Analog DT Adjustment (For DVW-A500P/A510P/CA510P)

- (1) Insert the alignment tape CR5-1B PS, and cue up the color bars signal portion (00:14:00:00).
- (2) Press the S300 switch on the SS-52 board to enter the maintenance mode.
- (3) Move the * mark to "A0: SERVO/DT ADJUST" by the search dial.
- (4) Press the SET button to enter "A0: SERVO/DT ADJUST".

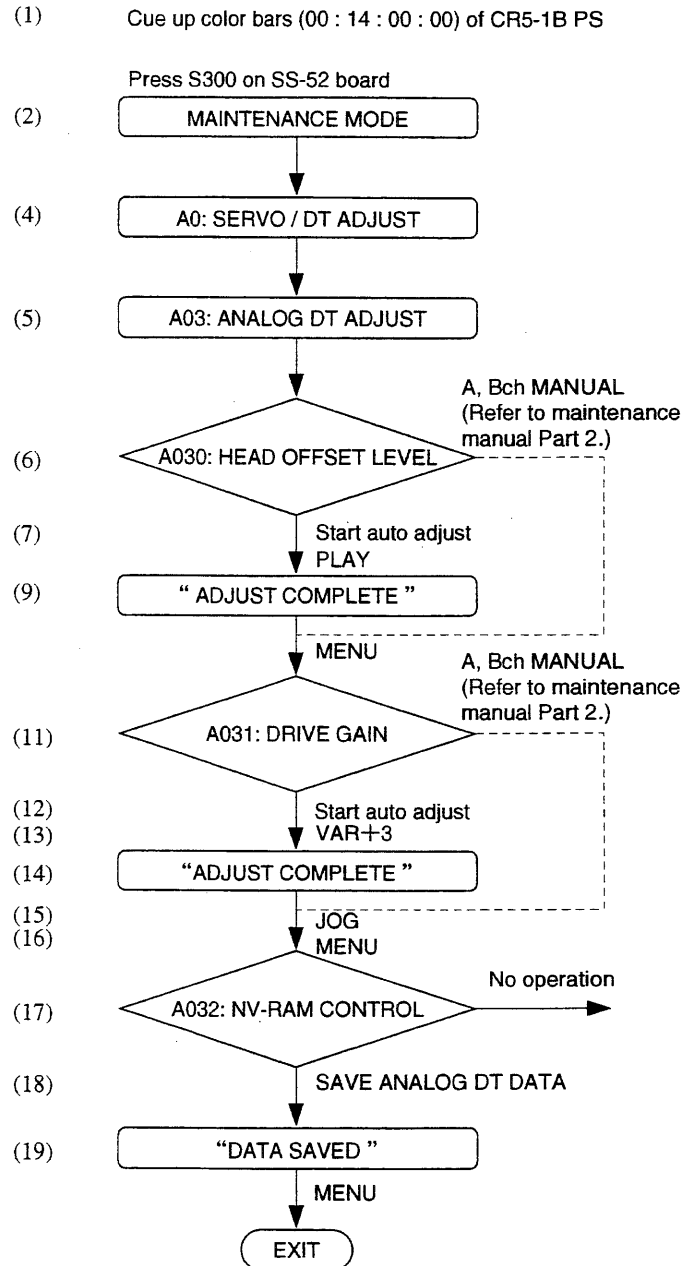

From this time on, operate the menu in the same way.

- (5) Enter "A03: ANALOG DT ADJUST" menu.
- (6) Enter "A030: HEAD OFFSET LEVEL".
- (7) Select "Start auto adjust".
- (8) Put the unit into the PLAY mode by pressing the PLAY button as instructed by monitor display.
- (9) After adjustment is completed, "ADJUST COMPLETE" is displayed.
- (10) Press the MENU button to return to ANALOG DT ADJUST display.
- (11) Enter "A031: DRIVE GAIN".
- (12) Select "Start auto adjust".
- (13) Set to VAR+3 times speed mode as instructed by monitor display, (Press VAR button on the control panel and turn the search dial clockwise.)
- (14) After adjustment is completed, "ADJUST COMPLETE" is displayed.
- (15) Press the JOG button on the control panel.
- (16) Press the MENU button to return to ANALOG DT ADJUST display.
- (17) Enter "A032: NV-RAM CONTROL".
- (18) Select "SAVE ANALOG DT DATA".
- (19) After adjustment data are saved in NV-RAM completely, "DATA SAVED" is displayed.

- (20) Press the MENU button several times to return to the operation mode.

Note

- Never eject the tape until the data saved. If ejecting, re-adjust.
- When adjustment is incomplete at "A030: HEAD OFFSET LEVEL", or "A031: DRIVE GAIN", "ADJUST INCOMPLETE" is displayed. Refer to section 5-2-7. Analog DT System Check.

8-5-4. SAT Check (For DVW-A500P/500P)

- (1) Prepare the alignment tape ZR2-1P which is cue upped the 00:25:00:00 portion by the time code.
- (2) Press S300 switch on the SS-52 board to enter the maintenance mode.
- (3) Move the * mark to "C0 : SERVO/DT CHECK" by the search dial.
- (4) Press the SET button to enter "C0 : SERVO/DT CHECK" mode.

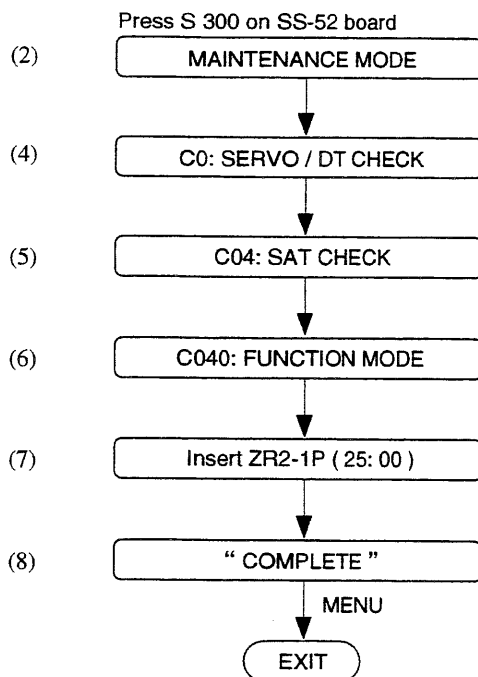

From this time on, operate the menu in the same way.

- (5) Enter "C04 : SAT CHECK" menu.
- (6) Enter "C040 : FUNCTION MODE".
- (7) Insert the alignment tape ZR2-1P as instructed by monitor display and execute "FUNCTION MODE".
- (8) After check is completed, "COMPLETE" is displayed.
- (9) Press the MENU button several times to return to the operation mode.

Note

When adjustment is incomplete at "C04 : SAT CHECK", error message is displayed. As for error message, refer to section 5-2-5. Servo System Check 5.

- (1) Cue up 00 : 25 : 00 : 00 portion of ZR2-1P.

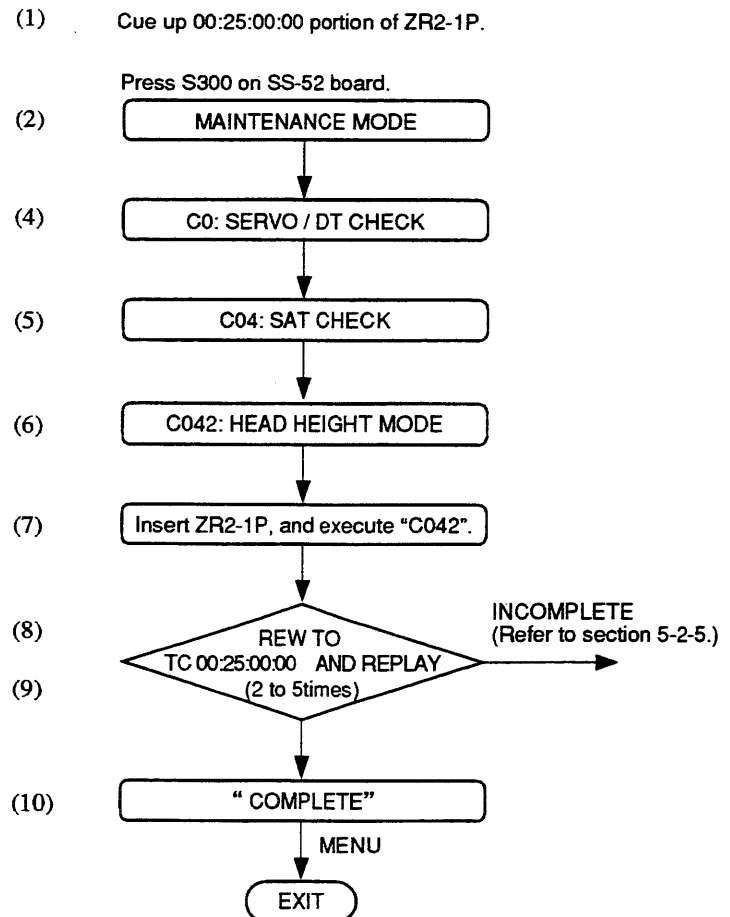

- (8)

8-5-5. Head Height Check SV1 ROM Version 1.20 and higher

- (1) Prepare the alignment tape ZR2-1P which is cued up at 00:25:00:00 portion by the time code.
- (2) Press S300 switch on the SS-52 board to enter the maintenance mode.
- (3) Move the *mark to "C0:SERVO/DT CHECK" by the search dial.
- (4) Press the SET button to enter "C0:SERVO/DT CHECK".
From this time on, operate the menu in the same way.
- (5) Enter "C04:SAT CHECK".
- (6) Enter "C042:HEAD HEIGHT MODE".
- (7) Insert the alignment tape ZR2-1P as instructed by monitor display and execute "HEAD HEIGHT MODE".
- (8) When "REW TO TC 00:25:00:00 AND REPLAY" is displayed on a monitor, rewind the alignment tape to the 00:25:00:00 portion. Press the PLAY button again.
- (9) Repeat the STEP (8) from 2 to 5 times until "COMPLETE" is displayed.
- (10) After "COMPLETE" is displayed and check is completed, the alignment tape is ejected automatically.
- (11) Press the MENU button several times to return the operation mode.

Note

When check is incomplete at "C042:HEAD HEIGHT MODE" is displayed. As for error message, refer to section 5-2-5. Servo System Check 5.

How to operate the maintenance mode

Push ⑧ S300(DIAG/ADJUST 1) (M-1) on the SS-52 board to enter the maintenance mode.

How to enter the next menu:

Press the ⑥ JOG button once. (Enters JOG mode.)
Turn the ⑦ search dial to move the * mark to a desired item.
Press the ③ SET button.

How to exit the current menu or the maintenance mode:

Press the ② MENU button.

How to operate a tape (e.g. PLAY) in the manual adjustment or other items:

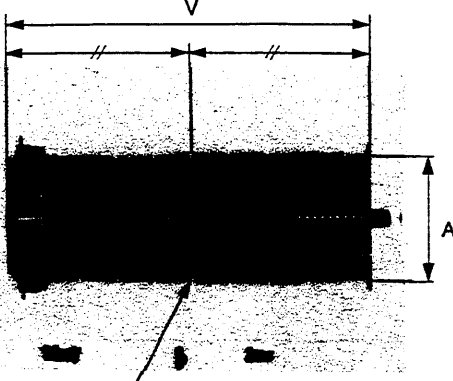

Press the ③ SET button to exit the maintenance mode temporarily. (A tape can be operated in this condition.)
Press the ② MENU button to return to the maintenance mode.

How to change the data (adjust the level) manually:

Turn the ⑦ search dial to move the * mark to the item wishing to be adjusted.
Turn the ⑦ search dial while pressing the ⑥ JOG button.

How to save the data:

Turn the ⑦ search dial to move the * mark to "A?F: NV-RAM CONTROL".
Press the ③ SET button.
Turn the ⑦ search dial to move the * mark to "SAVE ALL ADJUST DATA".
Press the ③ SET button.

*1. When this tape is reproduced in the audio reference level check or adjustment, the output level (0 dB) should be corrected according to the correction value as follows.

Example: Correction value = -0.5 dB
Output level = 0 dB - 0.5 dB = -0.5 dB

*2. When this tape is reproduced in the audio frequency response check or adjustment, the output level should be corrected according to the correction value.

CUE-1 board

CUE-1 Board (A Side)

CUE-1 Board (B Side)

CUE-1 board, the on-board switch

Switch S101 is not equipped in DVW-500P

Switch No.		Name	Description	FACTORY SETTING
S101	1	CH-1 AUDIO HEAD TUNE ADJ. SWITCH	By coupling with RV-106 on the CUE-1 board, adjust the CH-1 head amp high frequency response (head vibration). (Refer to Section 6 in Maintenance Manual Part 1) This switch is used in audio head dumping adjustment. If the switch setting is changed when this adjustment is not performed, audio frequency response may be failed.	When the unit is shipped, this switch is set to the position based on the adjustment condition.
	2			
S102	1	CH-2 AUDIO HEAD TUNE ADJ. SWITCH	By coupling with RV-107 on the CUE-1 board, adjust the CH-2 head amp high frequency response (head vibration). (Refer to Section 6 in Maintenance Manual Part 1) This switch is used in audio head dumping adjustment. If the switch setting is changed when this adjustment is not performed, audio frequency response may be failed.	When the unit is shipped, this switch is set to the position based on the adjustment condition.

8-7-7. Cue PB Level Adjustment

Up to Boards LOT No.305

Preparations for adjustment	Specifications	Adjustments
Step 1 <ul style="list-style-type: none"> Connect the audio level meter to TP110 and E108 on the CUE-1 board. Play back the 1 kHz, 0 VU signal portion(0:00-1:25) of the alignment tape ZR5-1P. 	TP110/CUE-1(C-2) -5.0 ± 0.1 dBu	PB LEVEL ADJ ●RV114/CUE-1(C-2)
Step 2 <ul style="list-style-type: none"> Play back the 1 kHz, 0 VU signal portion(0:00-1:25) of the alignment tape ZR5-1P. 	ANALOG AUDIO OUTPUT CUE 4.0 ± 0.1 dBu (terminated by 600 Ω)	PB REF ADJ ●RV120/CUE-1(A-3)

LOT No.306 and higher

Preparations for adjustment	Specifications	Adjustments
Step 1 <ul style="list-style-type: none"> Shorten *TP101 and E108 on the CUE-1 board with a shorting clip. Play back the 1 kHz, 0 VU signal portion (0:00-1:25) of the alignment tape ZR5-1P. 	ANALOG AUDIO OUTPUT CUE 4.0 ± 0.1 dBu (terminated by 600 Ω)	PB LEVEL ADJ ●RV114/CUE-1(C-2)
Step 2 <ul style="list-style-type: none"> Disconnect the shorting clip. Play back the 1 kHz, 0 VU signal portion (0:00-1:25) of the alignment tape ZR5-1P. 	ANALOG AUDIO OUTPUT CUE 4.0 ± 0.1 dBu (terminated by 600 Ω)	PB REF ADJ ●*RV120/CUE-1(A-3)

Notes

As for LOT No. 306 of the CUE-1 board, read the *marked TP and RV to the follows.

LOT No. 307 and higher : LOT No. 306
 TP101 : TP1 (DUS723)
 RV120 : RV1 (DUS723)

Boards LOT No. 307 and higher

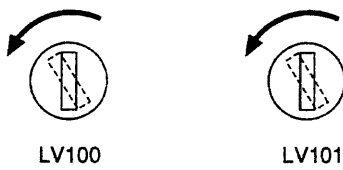

Up to LOT No. 306

8-7-8. Channel Erase Current Check

Preparations for adjustment	Specifications	Adjustments
Step 1 <ul style="list-style-type: none"> Connect the audio level meter to TP505(X) and TP502(G) on the CUE-1 board. Insert a digital tape, and set to REC mode. <ul style="list-style-type: none"> Disconnect the audio level meter, then observe the waveforms of TP505(X) and TP502(G) with the oscilloscope. 	TP505/CUE-1(F-1) Maximize the level TP505/CUE-1(F-1) 160 mV rms Distortion should not be appeared.	●LV500/CUE-1(G-1) ●RV502/CUE-1(G-3) CHECK
Step 2 <ul style="list-style-type: none"> Connect the audio level meter to TP507(X) and TP504(G) on the CUE-1 board. Insert a digital tape, and set to REC mode. <ul style="list-style-type: none"> Disconnect the audio level meter, then observe the waveforms of TP507(X) and TP504(G) with the oscilloscope. 	TP507/CUE-1(F-1) Maximize the level (The level should be more than 120 mV rms) Distortion should not be appeared.	●LV501/CUE-1(F-1) CHECK

8-7-9. Bias Tune and Bias Trap Adjustment

Preparations for adjustment	Specifications	Adjustments
Step 1 <ul style="list-style-type: none"> Connect the oscilloscope to TP500 on the CUE-1 board. Insert a digital tape, and set to REC mode. 	TP500/CUE-1(D-1) Maximize the level.	BIAS TUNE ● T500/CUE-1(E-1)
Step 2 <ul style="list-style-type: none"> Connect the oscilloscope to TP103 on the CUE-1 board. Insert a digital tape, and set to REC mode. 	TP103/CUE-1(D-3) Minimize the level. (The level should be less than 10 dBu.)  LV100 LV101 Note: Rotate LV100 and LV101 in parallel.	BIAS TRAP ● LV100/CUE-1(C-2) ● LV101/CUE-1(C-2)

8-7-10. Bias Current Adjustment

Preparations for adjustment	Specifications	Adjustments
<ul style="list-style-type: none"> Connect the audio level meter to TP105(X) and TP106(G) on the CUE-1 board. Insert a digital tape, and set to REC mode. 	TP105/CUE-1(B-1) 16.0 ± 0.5 mV rms	● RV500/CUE-1(D-2)

8-7-11. Cue OA Level Rough Check

Preparations for adjustment	Specifications	Adjustments
Step 1 <ul style="list-style-type: none"> Supply the 1 kHz, +4.0 dBu signal (terminated by 600 Ω) to AUDIO INPUT CUE on the connector panel. Insert a digital tape, and set to REC mode. Play back the recorded portion. The value of CUE OUT at this time is referred to as "value-1". 	<p>AUDIO OUTPUT CUE</p> <p>+4.0 \pm 0.5 dBu(terminated by 600 Ω)</p> <p>correction value = "value-1" -4.0</p> <p>If the correction value exceeds \pm0.5 dB, perform step 2.</p>	
Step 2 <p>Perform the following when the specification is not met.</p> <ul style="list-style-type: none"> Connect the audio level meter to TP100 on the CUE-1 board. REC mode The value of the audio level meter at this time is referred to as "value-2". 	<p>TP100/CUE-1(E-3)</p> <p>specification = "value-2" -correction value</p> <p>Adjust the level of TP100 to the specification, and check step 1 again.</p>	<p>REC LEVEL ADJ</p> <p>RV100/CUE-1(E-3)</p>

8-7-12. Cue OA Frequency Response Check

Preparations for adjustment	Specifications	Adjustments								
Step 1 <ul style="list-style-type: none">• Insert a digital tape, and record the 1 kHz, 7 kHz and 12 kHz (−16 dBu) signals.• Play back the recorded portion.• The values of CUE OUT at this time are referred to as “value-1(1),(7) and (12)”.	<p>ANALOG AUDIO OUTPUT CUE</p> <p>“correction value(7) or (12)”=“value-1(7) or (12)”−“value-1(1)”</p> <table><tr><th>FREQUENCY [Hz]</th><th>CORRECTION VALUE [dB]</th></tr><tr><td>1 k</td><td>0 (REF)</td></tr><tr><td>7 k</td><td>0 ±0.5</td></tr><tr><td>12 k</td><td>0 ±0.5</td></tr></table> <p>If the correction values exceed the specifications, perform step 2.</p>	FREQUENCY [Hz]	CORRECTION VALUE [dB]	1 k	0 (REF)	7 k	0 ±0.5	12 k	0 ±0.5	
FREQUENCY [Hz]	CORRECTION VALUE [dB]									
1 k	0 (REF)									
7 k	0 ±0.5									
12 k	0 ±0.5									
Step 2 <p>Perform the following when the specification is not met.</p> <ul style="list-style-type: none">• Connect the audio level meter to TP100 on the CUE-1 board.• Record the 7 kHz and 12 kHz (−16 dBu) signals.• The values of the level meter at this time are referred to as “value-2(7) and (12)”.	<p>TP100/CUE-1(E-3)</p> <p>specification(7) =“value-2(7)”−“correction value (7)”</p> <p>specification(12) =“value-2(12)”−“correction value(12)”</p> <p>Adjust the level of TP100 to each specification for each frequency, and check step 1 again.</p>	<p>7 kHz: ●RV103/CUE-1(E-3)</p> <p>12 kHz:●LV102/CUE-1(C-2)</p>								

8-7-13. Cue OA Level Check

Preparations for adjustment	Specifications	Adjustments
Step 1 <ul style="list-style-type: none"> Supply the 1 kHz, +4.0 dBu signal (terminated by 600 Ω) to AUDIO INPUT CUE on the connector panel. Insert a digital tape, and set to REC mode. Play back the recorded portion. 	ANALOG AUDIO OUTPUT CUE +4.0 \pm 0.2 dBu(terminated by 600 Ω)	RV100/CUE-1(E-3)

8-7-14. Cue OA Level Distortion Check

Preparations for adjustment	Specifications	Adjustments
<ul style="list-style-type: none"> Supply the 1 kHz, +4.0 dBu (terminated by 600 Ω) signal to AUDIO INPUT CUE on the connector panel. Insert a digital tape, and set to REC mode. Play back the recorded portion. 	ANALOG AUDIO OUTPUT CUE 2% or less	Check

8-7-15. LTC PB Level Check

Preparations for adjustment	Specifications	Adjustments
Step 1 • Connect the oscilloscope to TP402(X) and E400(G) on the CUE-1 board. • Play back the alignment tape ZR5-1P (any portion is acceptable).	TP402/CUE-1 (F-6)  $A \geq 80 \text{ mV p-p}$	check
Step 2 a) REW b) REV shuttle $\times 5$ c) REV shuttle $\times 1/5$ Play back at upper speed.	TP402/CUE-1 (F-6)  $A \geq 80 \text{ mV p-p}$	check If the specification is not met, clean the head. Nevertheless the specification is not met, perform section 8-4-10. Audio Level Adjustment again. Then, check from section 8-7-1. Audio PB Frequency Response Adjustment again.

8-7-16. LTC OA Check

Preparations for adjustment	Specifications	Adjustments
Step 1 <ul style="list-style-type: none"> Connect LTC OUT of the BVG-1600PS to TIME CODE IN on the connector panel. Connect the oscilloscope to TP400(X) and TP401(G) on the CUE-1 board. Insert a digital tape, and set to REC mode. 	TP401/CUE-1(E-5) $60 \pm 5 \text{ mV p-p}$	Check
Step 2 <ul style="list-style-type: none"> Connect BVG-1500PS to TIME CODE OUT on the connector panel. Play back the recorded portion at step 1. 	TIME CODE OUT Waveform can be observed by the BVG-1500PS.	Check
Step 3 <ul style="list-style-type: none"> Connect the oscilloscope to TP402(X) and E400(G) on the CUE-1 board. Play back the recorded portion at step 1 in the four modes which described below. A) PLAY B) REW C) REV SHUTTLEX5 D) REV SHUTTLEX1/5	TP402/CUE-1 (F-6)  $A \geq 80 \text{ mV p-p}$	Check

8-7-17. TC Insert Crosstalk Adjustment

Preparations for adjustment	Specifications	Adjustments
Step 1 <ul style="list-style-type: none"> Supply no signal to AUDIO INPUT CUE on the connector panel. Insert a digital tape, and set to REC mode. Rewind the recorded portion. Press the INSERT TIME CODE button. Press the EDIT button and PLAY button simultaneously. 	ANALOG AUDIO OUTPUT CUE Minimize the level. (The level should be less than -18 dBu) (30 kHz LPF) Adjust alternately to meet the specification and to be minimum level.	●RV400/CUE-1(F-6) ●RV401/CUE-1(F-6)

8-7-18. Cue Erasure Ratio Check

Preparations for adjustment	Specifications	Adjustments
<p>Step 1</p> <ul style="list-style-type: none"> • Supply the 1 kHz, +13.5 dBu signal (terminated by 600 Ω) to ANALOG AUDIO INPUT CUE on the rear panel. • Insert a digital tape, and set to REC mode. • Rewind half of the recorded portion. • Supply no signal to ANALOG AUDIO INPUT CUE. • Press the INSERT CUE button, then press the EDIT and PLAY buttons simultaneously. • Play back the recorded portion. • Measure the level of ANALOG AUDIO OUTPUT CUE through BPF(1 kHz). 	<p>ANALOG AUDIO OUTPUT CUE</p> <p>Difference of the level of signal portion and no signal portion.</p> <p>more than 65 dB</p>	<p>Check</p> <p>(1) If the specification is not met, clean the head.</p> <p>(2) If the specification is not met after performing (1), perform section 8-4-8. Audio/TC Head Head-to-Tape Contact Adjustment again. Then, check from section 8-7-1. Audio PB Frequency Response Adjustment again.</p>

SECTION 9

SPARE PARTS

9-1. NOTES ON SPARE PARTS

1. Safety Related Components Warning

Components marked \triangle are critical to safe operation.

Therefore, specified parts should be used in the case of replacement.

2. Standardization of Parts

Some repair parts supplied by Sony differ from those used for the unit. These are because of parts commonality and improvement.

Parts list has the present standardized repair parts.

3. Stock of Parts

Parts marked with "o" at SP(Supply Code) column of the spare parts list may be not stocked. Therefore, the delivery date will be delayed.

4. Tension Spring

(xxT) after a tension spring is shown on the parts list in order to indicate the number of spring turns required for the use.

(Example) TENSION, SPRING (20T):

This spring must be cut at its 20th turn for actual use.

5. Refer to the Installation and Maintenance

Manual for parts exclusive to the DVW-A500/1, 500/1, A500P/1, 500P/1 and the BKDW-515.

301	A-8267-795-E	s TENSION REGULATOR ASSY (RP)

SテンションレギュレータASSYの構成部品の交換は、厳密な調整を必要とするため、組立品で交換してください。

If the component parts of the S tension regulator assembly are needed to replace, replace as a whole assembled parts instead of as a component part because of the strict adjustment is required.
